PREFACE.

IN re-casting my 'NOTES FOR STUDENTS IN CHEMISTRY,' the SIXTH edition of which was published by Messrs. Churchill in 1878, I found myself so cramped for space that I omitted the SKELETON-NOTES ON ANALYSIS. Although, at the time, I had the full intention of reproducing them, business has prevented me to such an extent, that I had almost resolved to allow them to drop. But, partly pressed by my own pupils, partly and chiefly on the solicitation of my Colleague in Examinations, Dr. George Harley, F.R.S., I have reconsidered the matter. The result is the separate edition.

In passing the sheets through the press, I have to express my sincere thanks to my able Assistant Mr. C. G. Stewart.

If I do not entertain the same opinion as to the employment of Analytical Tables, as do some of my brethren, it is because of the ludicrous mistakes occasioned by their improper employment. It is true that our students in medicine have not much time to devote to the study of practical Chemistry, and that the requirements of the College of Surgeons are nearly *nil*: but, at the School of St. Thomas's Hospital, we take our stand upon the Examinations of the University

of London, and endeavor to satisfy the requirements of the Preliminary Scientific. When, then, an ordinary student is expected to be able to pass in Inorganic Qualitative Analysis, it is easy for him to extend his information by taking in the subjects of the First M.B. The skeleton-notes are suited for students at both these examinations.

ALBERT J. BERNAYS.

BERNAYS' NOTES

ON

ANALYTICAL CHEMISTRY.

Preliminary.

DISTILLED WATER has no effect upon the color of test-papers. It leaves **no residue** on evaporation, is inodorous and uninflam-
mable. Unaffected by argentum nitrate and by sodium car-
bonate. Acidulated with hydrochloric acid, no change of color by
hydrogen sulphide. If quite pure, no coloration with Nessler's
test (absence of ammonia), and no turbidity with lime-water
(absence of carbon dioxide).

Nearly all the salts of potassium, sodium, caesium, rubidium,
lithium and ammonium are soluble in water.

The CARBONATES, SULPHITES, PHOSPHATES, ARSENATES, ARSE-
NITES, BORATES, TARTRATES, OXALATES, CITRATES, URATES, CHRO-
MATES, SILICATES, of metals other than the alkaline metals are
more or less insoluble in water.

Most metals form hydroxides: those of KALIAM **KOH**, NATRIUM
NaOH, CAESIUM **CsOH**, RUBIDIUM **RbOH**, LITHIUM **LiOH** and
AMMONIUM **NH₄OH**,—of BARIUM **Ba(OH)₂**, STRONTIUM **Sr(OH)₂** and
CALCIUM **Ca(OH)₂**, are alone soluble in water. Their solutions
turn red litmus paper blue. ARGENTUM NITRATE **AgNO₃** occa-
sions in them a **grey-brown** precipitate, consisting of ARGENTUM
OXIDE **Ag₂O**, soluble in nitric acid, and in ammonia.

Therefore a solution of an hydroxide in water blues red litmus,
and is precipitated grey-brown by argentum nitrate: but,
CARBON DIOXIDE only precipitates BARIUM, STRONTIUM and CAL-
CIUM as carbonates, inasmuch as the carbonates of potassium,
sodium and ammonium are soluble in water.

CO_2 occasions milkiness in solutions of $\text{Ba}(\text{OH})_2$, $\text{Sr}(\text{OH})_2$ and $\text{Ca}(\text{OH})_2$.

A solution of $\text{Ba}(\text{OH})_2$, $\text{Sr}(\text{OH})_2$, and $\text{Ca}(\text{OH})_2$, is of course precipitated by a solution of SODIUM CARBONATE, and thus a separation can be made by precipitation of BaCO_3 , SrCO_3 , and CaCO_3 , from the hydroxides of potassium, sodium and ammonium (lithium, caesium and rubidium also).

N.B. As then the carbonates of the basylous metals, except those of the alkalis, are insoluble in water, a solution of an alkaline carbonate, — say of sodium carbonate Na_2CO_3 , occasions a white precipitate of an insoluble carbonate in solutions of metallic salts.

A solution of a salt may be neutral in the chemical acceptation of the word, and may yet redden blue litmus or turn red litmus paper blue. Thus, both CUPRIC SULPHATE CuSO_4 and SODIUM CARBONATE Na_2CO_3 are neutral salts, because the hydrogen in both acids H_2SO_4 and H_2CO_3 , is replaced by its equivalent of Na_2 and Cu . But Na_2CO_3 blues red litmus, and CuSO_4 reddens blue litmus. Sodium carbonate however gives a white precipitate with AgNO_3 and therefore they cannot be confounded with an hydroxide (see above).

SODIUM HYDRO-CARBONATE NaHCO_3 does not precipitate magnesium salts or solution of tartar emetic ($2[\text{KSbOC}_4\text{H}_4\text{O}_6], \text{H}_2\text{O}$) until heated. In presence of ammoniacal salts, together with certain metallic salts, such as zinc, magnesium, &c, heat may be necessary, even in using sodium carbonate as a precipitant; but little skill is however required in detecting ammonia *a.* by its smell, *b.* by fumes with hydrochloric acid, and *c.* by blue color to red litmus.

The presence of metallic salts other than of the alkaline metals is then detected by Na_2CO_3 , which occasions a precipitate.

If solution reddens test-paper strongly, there will be effervescence on addition of Na_2CO_3 : *a.* If effervescence without any precipitate even on boiling, then we have only to deal with a free acid, or an acid salt of alkaline metals. *b.* If effervescence first, with precipitate only becoming permanent on addition of excess of Na_2CO_3 , we have a metallic salt together with free acid. *c.* If no effervescence, or effervescence with permanent precipitate, then the reaction on the test-paper is due to the nature of the salt, and there is no free acid.

When a solution is **heated** in a test-tube, the latter should be kept in **continuous agitation**, to prevent ejection of the contents. **Beware** of adding concentrated acids to hot solutions. The tests should be employed **gradually**, as otherwise many indications are lost. Whilst **moderation** is suggested in the use of tests, care should be taken to add **sufficient quantities**, as otherwise serious mistakes may arise: thus **excess** must be employed in order to separate members of particular groups. If a liquid is **strongly acid**, dilute before adding most tests. When **filtration** is required, do not allow the **washings** to pass into the original liquid. Whenever it is possible to **decant** or pour off the clear liquid from the precipitate, it is easy to wash this way.

TABLE OF THE ELEMENTS, WITH THEIR SYMBOLS AND ATOMIC WEIGHTS, SPECIFIC GRAVITIES AND MELTING-POINTS.

Element.	Symbol.	At. Weights.	Sp. Gravity.	Melting-Point.
Aluminum . . .	Al	= 27.5 .	2.67 .	700°

Gramme	15.432349	Litre	61.027052

APPEARANCES OF THE MORE COMMONLY OCCURRING BODIES:—

Metallic lustre more or less marked. The metals, graphite, iodine, many metallic sulphides and arsenides as ores (lead, silver, copper, iron, tin, antimony, bismuth, nickel, cobalt; ferric, ferroso-ferric, and stannic oxides as ores, manganese peroxide (pyrolusite, crystallized), anhydrous ferric chloride.

Black. Most of the above in a finely divided state; the precipitated sulphides of lead, iron, bismuth (brownish), mercury, gold, platinum, silver, cobalt and nickel; manganese, nickel, and cobalt peroxides; reduced iron, lead, and platinum: ferrous, ferroso-ferric, stannous, mercurous, and eupric oxides; lead suboxide, cupric and other phosphides, ferric tannate and ferrous gallate (ink).

White or colorless. Salts of the following, unless the acid radicle be colored:—alkalies and alkaline earths, zinc, tin, aluminum, bismuth, antimony, cadmium, silver, mercury (neutral salts), lead, and copper in the euprous form. Alkaloids, sugars, starches, glycerine, alcohol, urea; if pure. Distilled water. Free acid radicles or hydrogen salts, except chlorine, bromine, iodine, and sulphur, chromic, bismuthic, hypochlorous and nitrous acids. Oxides and hydroxides of alkalies, alkaline earths, zinc and aluminum; plumbic and cadmic hydroxides; ferrous and manganous hydroxides (rapidly changing); ferric phosphate; most ferrous salts when anhydrous.

Yellow. Ferric salts (acid), most neutral chromates, basic salts of mercury, silver orthophosphate and arsenite; sulphur, soluble persulphides, cadmic, arsenious, and stannic sulphides; plumbic oxide ("massicot"), oxychloride ("Turner's yellow"), and iodide; mercuric oxide (precipitated), cuprous hydrate, zinc oxide when heated; potassio-cobaltous nitrite ("aurcolin");

bromide of starch; cadmium, nickel, mercuric and bismuth ferrieyanides; auric oxide and chloride, ammonio- and potassio-platinic chlorides.

Pale or Light yellow. Hypochlorous acid, chlorine water and gas, silver iodide, precipitated sulphur, lead antimoniate ("Naples yellow"), ferrous oxalate, antimonie anhydride, tannic acid, potassium ferrocyanide ("honey yellow"), mercuric chlorosulphide (changing from white to yellow, orange, red, brown, black).

Green. Cupric chloride, hydrocarbonate (malachite), basic acetate (also blue—"verdigris"), ferrieyanide, arsenite (Scheele's green), aceto-arsenite (emerald green); nickelous hydroxide, most ferrous and nickel salts; chromic oxide, hydroxide, and salts (also violet); aurous, nickelous and manganous oxides (dark olive); zinc cobaltate ("Rinman's green," blowpipe test), cobalt ferrocyanide (dirty green to grey) mercurous iodide (yellowish), manganates (intense bluish green, blowpipe test), nitrous acid (varies), potassium ferrocyanide solution (yellowish).

Blue. Cupric hydrate, hydrocarbonate (Chessylite), nitrate, sulphate, acetate, arsenate, &c.; basic and anhydrous cobalt salts, cobalt glass ("smalt"), cobalt aluminate ("Thenard's blue," blowpipe test), ultramarine, solution of nickelous hydroxide in ammonia.

Dark blue. Cupric salts with excess of ammonia, Fehling's test, Prussian blue, iodide of starch.

Violet or Purple. Chromic salts (also green), some cobalt compounds, purple of Cassius (auric stannate); ferrates and perchromic acid (unstable); murexide (uric acid test), solution of I in CS_2 or CHCl_3 , iodine vapor.

Crimson. Permanganates, argentic chromate.

Pink or flesh-colored. Manganous sulphide, chloride, sulphate, &c.; cobaltous hydroxide and many salts in solution; manganous cobaltate (blowpipe test).

Orange. Nitric acid containing nitrous, bromine water, antimonous sulphide, some chromates and ferric salts, zinc and argentic ferrieyanide, auric chloride (dry), nitrogen peroxide, bromine vapor.

Brick-red. Plumbic oxide (litharge) and chlorosulphide, arsenic and phosphorus iodides, realgar (As_2S_2), mercurous chromate.

Orange-red. Acid chromates, some ferric compounds, mercuric chromate (yellow at first).

Red. Basic lead chromate, red lead, cinnabar and vermilion (mercuric sulphide), cuprous oxide, chromic anhydride, mercuric oxide ("red precipitate"), and iodide.

Rose-red. Cobalt salts.

Brown-red. Ferric oxide, mercuric oxychloride ($\text{NaHCO}_3 +$

HgCl_2), amorphous phosphorus, solid potassium ferricyanide, sodium nitroprusside, manganic salts (unstable), reduced copper, ferric acetate, formate, meconate, and sulphocyanide, bromine, chlorochromic acid CrO_2Cl_2 , cupric ferrocyanide (maroon).

Brown. Reduced gold, ferric hydroxide (varies), plumbic peroxide, ferric succinate and urate (reddish), ferric benzoate (pale), blende (ZnS), cadmium oxide, bismuth iodide and bismuthic acid, stannous sulphide, silver arsenate, iodine water (light), iodine tincture and alkaline triiodides (deep), platinic chloride and other compounds, neutral ferric solutions, some oxides of chromium, uranium ferrocyanide (dark), manganous ferricyanide, cobalt ferricyanide (purple-brown), mercurammonium iodide (Nessler precipitate), cupric chromate (orange-brown), solution of cobalt hydroxide in ammonia (becomes red), sulphur vapor, plastic sulphur.

Grey. Precipitated antimony, arsenic, mercury and silver, silver oxide (brown-grey), cobaltous oxide, silver antimonide, anhydrous cupric sulphate.

[Many organic substances may be brown, yellowish or grey from impurity.]

USUAL APPEARANCES OF CRYSTALS:—

Transparent needles. Oxalic acid (also thicker and more opaque), magnesium, zinc, sodium, ammonium and quina sulphates, calcium chloride (deliquescent) urea, calcium sulphate (rather rare), ammonium nitrate, chloride and oxalate, gallic acid (minute), sodium acetate, cupric chloride, hydrated ferric chloride (brown, deliquescent), soluble succinates, potassium picrate (yellow), urea oxalate, [thein, and many alkaloids].

Opaque needles. Hippuric acid, morphia, strychnia, magnesium phosphate (minute), stannous chloride, lead acetate, mercuric and lead chlorides, potassium permanganate (dark purple), calcium benzoate, prismatic sulphur, potassium nitrate.

Pearly or resinous lustre : (a) **needles ;** silver acetate, aluminium sulphate, potassium ferricyanide.

(b) **plates or scales ;** benzoic acid and soluble benzoates, barium chloride, boracic acid, urea nitrate, potassium ferrocyanide (also massive square tables), barium hydrate, cadmium and lead iodides, chromic chloride (anhydrous, violet), potassium chlorate (?), [croton chloral, santonine, leucine, picric acid (also octahedra), some fatty acids, cholesterine, sebacic acid.] mercurous acetate.

Short, thick crystals : (a) **efflorescent ;** most sodium salts, alums (octahedra), tartar emetic, cupric and ferrous sulphates, lead acetate, mercurous nitrate.

(b) **deliquescent ;** malic, phosphorous and phosphoric acids, zinc acetate, cadmium nitrate, hydropotassic sulphate.

(c) **permanent**; potassium chromate, dichromate, hydro-carbonate, sulphate, binoxalate, &c., tartaric and citric acids (if pure), strontium nitrate, calc-spar (CaCO_3), Rochelle salt (sodium-potassic tartrate), sucrase, gypsum, &c.

(d) **opaque**; plumbic nitrate (very marked), succinic acid, lactose, potassium hydrogen tartrate, mercuric cyanide, cinchonine salts.

Cubes. Chlorides, bromides and iodides of alkaline metals (cyanides usually in mass), iron pyrites FeS_2 , galena PbS , fluor-spar CaF_2 . Potassium bromide is usually more transparent than the iodide.

Substances commonly met with in masses, cakes, or lumps: fused salts generally, especially the following:—

Structure pearly flakes: pure sodium and potassium hydroxides, potassium and sodium acetates. **Fibrous**; ammonium chloride. **Granular crystalline**: aluminum sulphate, mercuric chloride, potassium disulphate, fused calcium chloride, glucose, camphor, silver nitrate (sticks), potassium nitrate ("sal prunella," sticks or balls, "glob. prunel."), roll sulphur. These may also appear:

Amorphous: (a) **opaque**; arsenious anhydride (porcellaneous, stratified), common caustic potash and soda (sticks or cakes), fused antimonious sulphide (dark brown), potassium cyanide and nitrite, manganates (dark green), silicates, zinc chloride (deliquescent sticks), barium oxide.

(b) **transparent**; glacial phosphoric acid (deliquescent sticks or lumps), quartz and mixed silicates (glass), phosphorus (waxy, becomes opaque white, yellow, orange, red), sucrase in the form of barley sugar [gelatine, soluble albumen, gums, resins, &c.].

Gelatinous or flocculent bodies (Colloids). Hydric and many other silicates, most precipitates from solutions of aluminum, iron, chromium, manganese, nickel, and cobalt salts, potassium and barium silicofluorides, calcium fluoride, gelatine, albumen, starch when boiled, &c. Many precipitates at first flocculent become granular or even crystalline by heat or standing.

Crystalline precipitates. Potassium and ammonium hydro-tartrates, benzoic, hippuric, boric, arsenious, chromic, uric, gallic, salicylic and picric acids, ammonio- and potassio-platinic chlorides, magnesium and ammonio-magnesium phosphates (minute), plumbic chloride, bromide, iodide, and sulphocyanide, cuprous chloride, barium chloride and nitrate (by strong acids), silver acetate, potassic perchlorate, urea nitrate and oxalate.

Syrupy liquids. Concentrated solutions of very soluble bodies, such as potassium and sodium hydroxides, potassium carbonate, zinc and ferric chlorides, tartaric, malic and citric

acids, sucrose, &c.; glycerine; phosphoric, arsenic, sulphuric and lactic acids [gum, albumen, gelatine, &c.].

The above list embraces the substances most frequently met with, including a few characteristic ones out of the range of ordinary analysis, and omitting the majority of bodies enumerated in the table of colors.

The **amorphous powders** are too numerous to specify. Opaque dead-looking powders are usually insoluble in water. If colored, a heavy metal is generally present. "Scale preparations," such as citrates and tartrates of iron, simulate crystals, but are irregular in form. Substances may be colored yellowish, brownish, &c., by impurity; this is frequently the case with glucose, tannin, alkaloids, malic, uric and meconic acids. Pulverization generally diminishes color in proportion to the fineness of the division; sometimes the tint is removed or entirely changed. As a rule, colored bodies, if soluble in water, give solutions of the same or similar hue, ferro- and ferri-yanides being notable exceptions. Lead and mercuric iodides give colorless solutions, so also do many other bodies in dissolving in acids. The deep blue tint of ammonio-cupric solutions is removed by potassium cyanide. The color of precipitates often varies with different circumstances of precipitation.

Fluorescent bodies. Quina salts in solution [chlorophyll, æseulin, eosin, "paraffin oil," uranium compounds].

Substances more or less dichroic. Some salts of chromic oxide, potassium ferri-yanide, platino-cyanides, nickel hydroxide in ammonia, [most aniline dyes, indigo,] Prussian blue, potassium permanganate crystals.

Characteristic odors. Cl, Br, I, SO_2 , H_2S , [H_2Se , H_2Te], HCl, HBr, HI, HCN, $(\text{CN})_2$, HF, NO_2 , NH_3 ; PH_3 (stinking fish), As and AsH_3 (garlic); Cl_2O (from hypochlorites); acetic, formic, and benzoic acids; burnt sugar (sugars and tartaric acid on heating); burnt feathers (protein compounds by heat); pleasant ethereal (acetic and formic ethers, from acetates and formates, by heating with alcohol and H_2SO_4); aldehyd (from alcohol by $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4); alcohol (nearly inodorous when pure), [ether, chloroform, CS_2 and a large number of organic compounds]; acrolein (intensely pungent, from glycerin by KHSO_4 and heat); pungent odor from oxalic, benzoic, citric and succinic acids by heat.

PREPARATORY EXPERIMENTS.

Carefully note appearances: if a solid, is it metallic, colored, white or colorless (p. 5); crystalline (p. 7) or amorphous?

HEAT IN SMALL GLASS-TUBE. *a.* volatilize readily: salts of NH_4 with volatile radicles,—of Hg or Hg_2 ,— As_2O_3 or As_2O_5 ,—certain chlorides as of Sn, Sb, &c.,—certain organic bodies,—water of crystallization, &c. *b.* fuse without blackening: hydroxides of K, Na, Ba,—salts of alkalies and alkaline earths,—boracic, phosphorous and phosphoric acids, &c. *c.* evolve nitrous fumes, nitrates and nitrites. *d.* evolves Cyanogen, kindling with peachblossom-colored flame,—cyanides of Ag, Hg. *e.* give off brown vapors, burning with odor of sulphur dioxide,—sulphur and certain sulphides. *f.* blacken or char,—certain organic bodies,—various salts with metallie bases. Those of the alkaline metals K and Na leave a residue of a carbonate, alkaline to test-paper, and soluble with effervescence in HCl. *g.* undergo no change,—silica, barium, strontium, and calcium sulphates.

ASCERTAIN IF SUBSTANCE IS SOLUBLE IN WATER.

Place a few grains in a test-tube, and add a little distilled water; shake and heat carefully. If soluble, note whether solution colorless or colored.

I. THE SUBSTANCE IS SOLUBLE IN WATER.

1. USE RED LITMUS PAPER: it is turned blue. *a.* Add SODIUM CARBONATE: no reaction even after stirring and heating (if required); it is either potassium or sodium hydroxide or a salt of K or Na with alkaline reaction. To a fresh portion add SILVER NITRATE: the precipitate is greyish-brown, soluble in NH_3 and in HNO_3 ; it is KOH or NaOH. The precipitate is liver-brown, soluble in NH_3 and in HNO_3 , it is an alkaline arsenate. The precipitate is yellow, soluble in NH_3 and in HNO_3 , it is an alkaline arsenite or phosphate. Yellow, and insoluble, an iodide. The precipitate is white, and easily soluble in HNO_3 and in NH_3 ,—an alkaline borate, sulphite, carbonate, tartrate, oxalate, acetate, benzoate, citrate, hippurate or succinate. The precipitate is white and curd-like, with difficulty soluble in NH_3 and only soluble in boiling HNO_3 ,—an alkaline cyanide. The precipitate is white, yellow, orange and, by heat, black,—an alkaline hyposulphite. The precipitate is black,—an alkaline sulphide.

N.B. Many other salts of K, Na, and NH_4 are precipitated by AgNO_3 , but they are either neutral, or acid, to test-paper. Salts of ammonium would be recognized by Na_2CO_3 , as ammonium carbonates are volatile, odorous of NH_3 , which turns red litmus blue, and fumes with glass-rod dipped in HCl.

1. Examine the solution with test-papers. LITMUS PAPER

BLUED. β . add sodium carbonate: an immediate white precipitate. To a fresh portion add silver nitrate,—a grey-brown precipitate, soluble in HNO_3 , and in HNO_3 , it is a hydroxide of barium, strontium or calcium.

2. Examine the solution with test-paper. BLUE LITMUS IS REDDENED. γ . Add solution of sodium carbonate Na_2CO_3 . EFFERVESCENCE without any precipitation or turbidity,—either a free acid is present, or an acid salt of K, Na or NH_4 . EFFERVESCENCE, with permanent turbidity or precipitate, and with resolution until free acid is neutralized,—free acid together with soluble salt of alkaline earth, earthy or any heavy metal. NO EFFERVESCENCE, but precipitate at once: then the reddening of the litmus is due only to the nature of the metallic salt, as many salts have an acid reaction. NO EFFERVESCENCE, and only a precipitate after long stirring,—probably a salt of quina, cinchona, morphia or strychnia. NO EFFERVESCENCE, and a precipitate on heating,—tartar emetic. NO EFFERVESCENCE, and no precipitate,—possibly mercuric cyanide.

3. Examine with test-papers, red and blue: NO CHANGE OF COLOR. δ . Add solution of sodium carbonate. NO PRECIPITATE, even on boiling: absence of all salts, except of K, Na and NH_4 . A PRECIPITATE: presence of any neutral metallic salts, as of Ba, Sr, Ca, &c.

It should be noticed that sodium hydro-carbonate NaHCO_3 only precipitates salts of magnesium and tartar emetic when heated, or on long standing, and does not precipitate mercuric cyanide.

In further testing for the metals, the latter are divided into 6 groups, according to precipitation, or otherwise.

GROUP I. By HCl precipitated as CHLORIDES: lead, silver and mercurous. PbCl_2 , AgCl and Hg_2Cl_2 .

GROUP II. By $\text{HCl} + \text{H}_2\text{S}$, precipitated as sulphides. *a.* SULPHIDES soluble in $(\text{NH}_4)_2\text{S}_2$: arsenicum, antimony, stannous and stannic (gold and platinum), As_2S_3 , Sb_2S_3 , SnS_2 , Au_2S_3 and PtS_2 . *b.* SULPHIDES, insoluble in $(\text{NH}_4)_2\text{S}_2$: lead, mercuric, bismuth, copper and cadmium, PbS , HgS , Bi_2S_3 , CuS , CdS . [A ferric salt is reduced in acid solutions, by H_2S , into a ferrous salt, and a salt of chromic acid into a salt of chromic oxide, with deposit of yellow sulphur. A similar deposit occurs in solutions of chlorine, bromine, iodine and HNO_3 . Arsenates only precipitated, after long boiling, and by large excess.]

GROUP III. By NH_4OH , after addition of NH_4Cl to original solution, the hydroxides of ferric, chromic and aluminic $\text{Fe}_2(\text{OH})_6$, $\text{Cr}_2(\text{OH})_6$ and $\text{Al}_2(\text{OH})_6$ are precipitated.

GROUP IV. By $(\text{NH}_4)_2\text{S}_2$ in presence of NH_4Cl , as sulphides, zinc, manganous, ferrous, cobalt and nickel, ZnS , MnS , FeS , CoS , NiS .

GROUP V. By $(\text{NH}_4)_2\text{CO}_3$ in presence of NH_4Cl , as carbonates, barium, strontium and calcium, BaCO_3 , SrCO_3 , CaCO_3 .

As already stated, Na_2CO_3 precipitates all these metals, with the exception of those which have acid characters, such as As_2O_3 , As_2O_5 and CrO_3 . So then magnesium would be precipitated, and if no other reaction answers, it is a salt of Mg .

GROUP VI. No reaction. K , Na , (Cs , Rb , Li), or NH_4 . This group is determined by the Na_2CO_3 test, which also discovers the presence or otherwise of NH_4 . If not a salt of NH_4 , add $\text{HCl} + \text{PtCl}_4$: a yellow precipitate, $2\text{KCl}, \text{PtCl}_4$; if none, Na .

The colors communicated to flame are very helpful, but as a rule it is better not to heat upon platinum-foil until we have ascertained something of the character of the unknown compound by means of test-papers, Na_2CO_3 and AgNO_3 . Salts of K , violet. Na , yellow. If K and Na together, look through blue glass, which absorbs the yellow rays. Li , purple-crimson. Sr , crimson. Ca , yellow-red. Cu , green or blue. Ti , green. Ba , yellowish-green. B_2O_3 , green. P , green. As , bluish. Sb , greenish-white.

II. THE SUBSTANCE IS INSOLUBLE IN WATER (see p. 41).

ANALYSIS OF AQUEOUS SOLUTIONS, CONTAINING ONE HYDROXIDE, OR ONE ACID, OR ONE RADICLE OR A SIMPLE SALT.

Tests for bases in soluble salts.

a. Look to color. b. Whether neutral, alkaline or acid to litmus paper. c. Add Na_2CO_3 ; a white precipitate, therefore a heavy metal is present. [A salt of quina, cinchona, morphia or strychnia would also be precipitated. *First M.B. examination at University of London*, see pp. 43-51.]

Group I. Hydrochloric acid* precipitates the chlorides of lead

* HCl will also precipitate basic antimonous chloride, soluble in excess, from solutions of tartar emetic; cream of tartar from potassium tartrate; arsenious acid from soluble arsenites, and the respective acids from alkaline borates, silicates, titanates, antimonates, stannates, molybdates, tungstates;

PbCl_2 , (thallium TlCl), mercurous Hg_2Cl_2 and silver AgCl . Their sulphides are black or brown-black and insoluble in $(\text{NH}_4)_2\text{S}_2$.

1. Lead oxide PbO , yellow. Hydroxide $\text{Pb}(\text{OH})_2$, white and soluble in KOH . [Chief soluble salts: acetate, nitrate and chloride. Neutral or feebly acid to test-paper. Goulard's extract, alkaline] HCl as white PbCl_2 , soluble in HCl in excess, and in much water: not in NH_3 and unchanged white. H_2S black sulphide, PbS . In solutions of PbCl_2 in HCl , H_2S gives red precipitate of lead chloro-sulphide $2\text{PbCl}_2, 3\text{PbS}$, turning to black PbS when H_2S in excess. Na_2CO_3 , already used: precipitate of white lead $\text{Pb}(\text{OH})_2, 2\text{PbCO}_3$. KOH , white hydroxide soluble in excess. NH_4OH white hydroxide, either at once or on heating. H_2SO_4 white lead sulphate PbSO_4 , soluble in ammonium acetate. $\text{K}_2\text{Cr}_2\text{O}_7$, yellow lead chromate PbCrO_4 , soluble in KOH . KI yellow PbI_2 , soluble in much boiling water. POTASSIUM FERROCYANIDE K_4FeCy_6 , white lead ferrocyanide Pb_2FeCy_6 . Lead easily precipitated by Zinc. Before blowpipe on charcoal, bluish lustrous bead, malleable: inerustation of yellow oxide. Pb is estimated as PbSO_4 with 68.32 per cent. of metal. Lead must be sought for in Group II., as lead chloride is soluble in much water.

[2. Thallium oxide Tl_2O , in hydrated pale-yellow prisms, very soluble in water, and with alkaline reaction TlOH . HCl yellowish-white TlCl , little soluble in HCl . H_2S scarcely a reaction, but NH_4HS brown-black sulphide TlS . Na_2CO_3 , white precipitate in concentrated solutions. H_2SO_4 no reaction. K_2CrO_4 pale-yellow precipitate Tl_2CrO_4 . KI reddish-yellow TlI . PtCl_4 little soluble 2TlCl , PtCl_4 . Metallic zinc precipitates Tl . Salts give green color to flame. Reduced upon charcoal.]

3. Mercurous oxide Hg_2O , black. (Chief salt NITRATE; strongly acid. MERCUROS CHLORIDE or calomel is insoluble in water, sublimes when heated, blackened by NH_3 forming $\text{NH}_2\text{Hg}_2\text{Cl}$, and soluble as mercuric chloride in aqua regia.) HCl whitish Hg_2Cl_2 , insoluble in water, and into black $\text{NH}_2\text{Hg}_2\text{Cl}$ by NH_3 ; easily oxydized by HNO_3 into HgCl_2 and Hg_2NO_3 , with evolution of nitrous fumes. H_2S black Hg_2S , soluble in aqua regia as mercuric chloride, (and then precipitated yellow, orange, black, by H_2S .) Na_2CO_3 black precipitate of Hg_2O . KOH black Hg_2O . NH_3 black Hg_2O . $\text{K}_2\text{Cr}_2\text{O}_7$, brick-dust colored

aluminum and zinc hydroxides from solutions in alkalis; sulphur from the higher sulphides of alkalis and alkaline earths; sulphur with evolution of sulphur dioxide from hyposulphites; uric acid, hippuric acid, benzoic acid, and gallic acids from alkaline salts. HCl will immediately remove CO_2 from carbonates; HNO_2 from nitrites; HCN from cyanides, &c., &c.

Hg₂CrO₄. **KI** yellow-green **Hg₂I₂.** **K₄FeCy₆** white mercurous ferrocyanide. **SnCl₂** first a precipitate of mercurous chloride and then of grey mercury. Thus: **Hg₂Cl₂ + SnCl₂ = Hg₂ + SnCl₄.** Copper, zinc and iron, precipitate **Hg**. Mercury is usually estimated as **Hg**. Salts reduced in tube with **Na₂CO₃**. Heated on platinum, **Hg₂NO₃** first white, yellow, red, black, and then volatilized.

4. **Argentum oxide Ag₂O** grey-brown, soluble in **NH₃**. (Chief salts: nitrate and sulphate. Neutral to test-paper.) **HCl** white, curd-like **AgCl**, insoluble in water, (soluble in concentrated **HCl**, in solution of **NaCl**, &c., but re-precipitated on addition of water,) soluble in **NH₃**, and changing in color from white to violet on exposure to light. **H₂S** brown-black **Ag₂S**, soluble in boiling **HNO₃**. **Na₂CO₃** white **Ag₂CO₃**, soluble in **NH₃** and salts. **KOH** grey-brown **Ag₂O**, soluble in **NH₃** and in **HNO₃**. **NH₃**, like **KOH**, but precipitate so soluble, that, in presence of free acid, there is no precipitate. **K₂Cr₂O₇**, crimson **Ag₂CrO₄**. **KI** yellow **AgI**, insoluble in **NH₃** and in **HNO₃**: iodide thus distinguished from a chloride. **POTASSIUM CYANIDE KCN** white, curd-like **AgCN**, soluble in excess of precipitant. **Cu**, **Fe**, **Hg**, **Zn**, precipitate **Ag**. On charcoal, with **Na₂CO₃**, or alone, reduced to white, lustrous bead, without incrustation: malleable. **Silver** is weighed as chloride, containing 75.26 per cent. of silver, or as silver.

GROUP II. **HCl + H₂S** precipitates: A. as sulphides soluble in **(NH₄)₂S₂**, yellow **As₂S₃** and pale-yellow **SnS₂**; orange **Sb₂S₃**; brown **SnS**; black **Au₂S₃** and **PtS₂**: B. as sulphides, insoluble in **(NH₄)₂S₂**, yellow **CdS**; deep-brown **Bi₂S₃**; blue-black **PbS**; brown-black **CuS**; black **HgS** and **PdS**.

N.B.—A FERRIC SALT is reduced to a FERROUS, and a salt of CHROMIC ACID to one of CHROMIC OXIDE by **H₂S**.

A. Sulphides soluble in **(NH₄)₂S₂**.

Arsenicum as arsenious anhydride **As₂O₃**, or as a soluble arsenite (DI-POTASSIUM HYDROGEN ARSENITE **K₂HAsO₃**, the common salt: strongly alkaline, colorless. no reaction with **Na₂CO₃**, and yellow precipitate with **AgNO₃**, soluble in **HNO₃** and in **NH₃**). IN ALKALINE ARSENITES. **HCl**, in concentrated solutions, a white precipitate of **As₂O₃**, soluble in excess. **HCl + H₂S**, bright-yellow **As₂S₃**, soluble in **NH₃**, in **(NH₄)₂CO₃** and in **(NH₄)₂S₂**. **CuSO₄**, green **CuHAsO₃**, soluble in **NH₃**. **AgNO₃**, yellow **Ag₃AsO₃**, soluble in **NH₃** and in **HNO₃**. **BaCl₂**, white **BaHAsO₃**, soluble in **HCl**. IN SOLUTIONS OF ARSENIOS ACID. Litmus is reddened, yet

no visible reaction with Na_2CO_3 . CuSO_4 no reaction until NH_3 carefully added, so as to form an arsenite: then "Scheele's Green" CuHAsO_3 . AgNO_3 , no reaction until NH_3 carefully added. **Reinsch's test:** Cu and HCl added to solution:—a steel-grey deposit of copper arsenide: the metal withdrawn, washed, dried in water-bath, heated in glass-tube: As_2O_3 sublimes in octohedra. **Marsh's test:** Mg or Zn in presence of H_2SO_4 , yields AsH_3 , burning with bluish-white flame to H_2O and As_2O_3 : if incompletely burnt, As is deposited, soluble in CaOCl_2 . Also filter-paper moistened with AgNO_3 may be suspended in tube where AsH_3 is evolved; Ag is deposited. Avoid HNO_3 , as solid hydride may be formed. On charcoal, mixed with Na_2CO_3 , garlic odor, and bluish-white flame. Heated in tube with black flux As volatilizes: $2\text{As}_2\text{S}_3 + 6\text{K}_2\text{CO}_3 + 6\text{C} = 6\text{K}_2\text{S} + 6\text{CO} + 6\text{CO}_2 + \text{As}_4$.

Arsenicum, as **arsenic acid** H_3AsO_4 . In solutions of **arsenates** (the alkaline are alone soluble and colorless: chief soluble salt $\text{Na}_2\text{HAsO}_4 \cdot 12\text{H}_2\text{O}$), $\text{HCl} + \text{H}_2\text{S}$ occasions no immediate precipitate: but if excess of H_2S be added, and about 20 drops reduced, by boiling, to three, the further addition of H_2S gives an immediate yellow precipitate of $\text{As}_2\text{S}_3 + \text{S}_2$. AgNO_3 liver-brown precipitate, both in H_3AsO_4 and in arsenates, soluble in NH_3 and in HNO_3 : CuSO_4 , no precipitate in H_3AsO_4 , but a pale greenish-blue pr. of CuHAsO_4 in alkaline arsenates. MgSO_4 in presence of NH_3 and a salt of NH_4 , a white crystalline precipitate of $\text{MgNH}_4\text{AsO}_4 \cdot 6\text{H}_2\text{O}$, isomorphous with $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$. BaCl_2 in arsenates, a white precipitate of BaHAsO_4 , soluble in HCl . For other tests, see As_2O_3 .

5. **Stannic oxide** SnO_2 , brown. **HYDROXIDE** $\text{SnO}(\text{OH})_2$. Chief salts: **STANNIC CHLORIDE** SnCl_4 and **SODIUM STANNATE** $\text{Na}_2\text{SnO}_3 \cdot 3\text{H}_2\text{O}$. Solution of SnCl_4 , colorless, strongly acid: effervesces first with Na_2CO_3 , and then permanent gelatinous hydroxide. $\text{HCl} + \text{H}_2\text{S}$ dirty yellow $\text{SnS}_2 \cdot \text{H}_2\text{O}$, soluble in $(\text{NH}_4)_2\text{S}_2$ and in KOH . KOH white hydroxide, soluble. NH_4OH , white. Zn precipitates Sn . On charcoal with Na_2CO_3 , a globule of lustrous tin, malleable, and with white incrustation. Tin is weighed as SnO_2 containing 78.66 per cent. of metal.

6. **Antimonous oxide** Sb_2O_3 , white. **HYDROXIDE**, white. Chief salts: **ANTIMONOUS CHLORIDE** SbCl_3 strongly acid, and **TARTAR EMETIC** $2(\text{KSbOC}_4\text{H}_4\text{O}_6)\text{H}_2\text{O}$ faintly acid. On addition of Na_2CO_3 to SbCl_3 , a white precipitate of hydroxide, with effervescence: with tartar emetic scarcely any till warmed. Water alone precipitates SbCl_3 , as $\text{SbOCl} + 2\text{HCl}$, soluble in **TARTARIC ACID** $\text{C}_2\text{H}_2(\text{OH})_2(\text{COOH})_2$, and precipitated as orange

sulphide by H_2S . HCl in sols. of tartar emetic a white pree. soluble in excess. $\text{HCl} + \text{H}_2\text{S}$ orange Sb_2S_3 , soluble in $(\text{NH}_4)_2\text{S}_2$, in KOH and in HCl . KOH white Sb_2O_3 , soluble. NH_4OH , white Sb_2O_3 : only by heat in tartar emetic. REINSCH'S TEST: Cu covered with violet-grey deposit of Sb : by strong heat in tube, Sb_2O_3 volatilized in needles. Or, the deposit heated with KOH , exposing the metal freely to the air, gradually oxydized and dissolved: then diluting, passing H_2S , filtering from CuS and adding H_2S , when orange Sb_2S_3 thrown down. MARSH'S TEST: Sb soluble in $(\text{NH}_4)_2\text{S}_2$, and separating, on evaporation, as Sb_2S_3 . Or, SbH_3 from Marsh's test, against paper soaked in AgNO_3 , yields black SbAg_3 . Zn in presence of HCl precipitates Sb in platinum-dish as black powder on the Pt . Sn precipitates Sb . Sb_2S_3 is separated from As_2S_3 by $(\text{NH}_4)_2\text{CO}_3$. Antimony is weighed as Sb_2O_3 , containing 79.22 per cent. of metal. Separated from Pb , Cu , Bi , Ag and Fe by K_2S_2 , in which Sb_2S_3 is soluble.

7. Stannous oxide SnO black; HYDROXIDE $2\text{SnO}, \text{H}_2\text{O}$ white. Chief salt STANNOUS CHLORIDE $\text{SnCl}_2, 2\text{H}_2\text{O}$, colorless, strongly acid, effervesces with Na_2CO_3 which throws down the hydroxide. Solution, when not too much free acid, decomposed by water into white OXYCHLORIDE $\text{SnO}, \text{SnCl}_2, 2\text{H}_2\text{O}$. $\text{HCl} + \text{H}_2\text{S}$, light brown hydrated sulphide $\text{SnS}, \text{H}_2\text{O}$, soluble by heat as STANNIC SULPHIDE SnS_2 in $(\text{NH}_4)_2\text{S}_2$ and re-precipitated as yellow SnS_2 on addition of HCl . Stannous sulphide is soluble in boiling HCl . KOH white hydroxide, soluble in excess. Boiled with insufficient potassium hydroxide to dissolve $2\text{SnO}, \text{H}_2\text{O}$, black crystalline needles of SnO obtained. NH_4OH , white hydroxide. HgCl_2 , first precipitates white Hg_2Cl_2 , and, in excess, grey metallic mercury: $\text{SnCl}_2 + 2\text{HgCl}_2 = \text{SnCl}_4 + \text{Hg}_2\text{Cl}_2$. Then $\text{SnCl}_2 + \text{Hg}_2\text{Cl}_2 = \text{SnCl}_4 + \text{Hg}_2$. AURIC CHLORIDE AuCl_3 in presence of a little SnCl_4 as well as SnCl_2 , produces Purple of Cassius. On CHARCOAL, with Na_2CO_3 , a white lustrous bead of tin, with incrustation of SnO_2 . Tin is weighed as SnO_2 , containing 78.66 per cent. of metal. When tin and antimony together, their chlorides decomposed by Zinc, the two metals washed, dried and weighed, re-dissolved in weak aqua regia, and the antimony removed by metallic tin.

[8. Auric oxide Au_2O_3 , brown; HYDROXIDE $\text{Au}_2\text{H}_6\text{O}_6$, is yellow. Chief salt AURIC CHLORIDE AuCl_3 , dark-red, deliquescent, or yellow-red. Strongly acid to test-paper: colored. $\text{HCl} + \text{H}_2\text{S}$, black $\text{Au}_2\text{S}, \text{Au}_2\text{S}_3$, soluble in $(\text{NH}_4)_2\text{S}_2$. KOH yellow-brown AURATE $\text{KAuO}_2, 3\text{H}_2\text{O}$, soluble. NH_4OH , olive-brown, fulminating nitride. SnCl_2 , containing a little SnCl_4 , yields Purple of Cassius $\text{SnAu}_2\text{Sn}_2\text{O}_6, 4\text{H}_2\text{O}$. Metallic tin gives similar precipitate. Oxalic acid reduces Au_2Cl_3 to metallic gold: $2\text{AuCl}_3 + 3\text{H}_2\text{C}_2\text{O}_4 = 6\text{HCl} + 6\text{CO}_2 + 2\text{Au}$, as a brown powder, malleable,

lustrous, golden when flattened in mortar. FeSO_4 , also reduces Auric chloride: $6\text{FeSO}_4 + 2\text{AuCl}_3 = \text{Fe}_2\text{Cl}_6 + 2(\text{Fe}_2\text{SO}_4) + 2\text{Au}$. Hg_2NO_3 also precipitates gold. Gold is weighed as gold.]

[9. **Platinic oxide** PtO_2 , blackish-brown; **HYDROXIDE** reddish-brown. Chief salt: **PLATINIC CHLORIDE** PtCl_4 , reddish-brown or reddish-yellow, acid to test-paper. $\text{HCl} + \text{H}_2\text{S}$, brown PtS_2 , immediately on heating, only soluble in aqua regia, and in large excess of $(\text{NH}_4)_2\text{S}_2$. NH_4Cl and KCl (CsCl and RbCl) produce respectively yellow precipitates of $2\text{NH}_4\text{Cl}, \text{PtCl}_4$ and $2\text{KCl}, \text{PtCl}_4$ ($2\text{CsCl}, \text{PtCl}_4$ and $2\text{RbCl}, \text{PtCl}_4$). By these reactions, Pt easily recognized. When heated, Pt remains as an infusible grey powder, flattened under pestle in mortar into lustrous metal. SnCl_2 reduces PtCl_4 to dark-brown PtCl_2 . On charcoal, reduced to grey powder, soluble with reddish-brown color in aqua regia. Platinum is weighed either as metal; as $2\text{KCl}, \text{PtCl}_4$, containing 40.36 per cent., or as $2\text{NH}_4\text{Cl}, \text{PtCl}_4$ containing 44.18 per cent. of Pt.]

Group II. B. continued. $\text{HCl} + \text{H}_2\text{S}$ precipitates Cadmium sulphide CdS , yellow; Bismuth sulphide Bi_2S_3 , deep-brown; Lead sulphide PbS , blue-black; Cupric sulphide CuS , Mercuric sulphide HgS , and Palladium sulphide PdS , black. Also a deposit of Sulphur (yellow or white) from ferric salts which are yellow, yellow-red or red-brown, and from salts of chromic acid which are yellow or yellow-red.—The sulphides are insoluble in ammonium disulphide or sulphide. Cd. Bi. Pb. Cu. Hg. Pd.

10. **Cadmium oxide** CdO , brown. **HYDROXIDE** $\text{Cd}(\text{OH})_2$ white, soluble in NH_4OH . Soluble salts colorless, faintly or distinctly acid to test-paper. Chief salts: Cd_2NO_3 , $\text{CdSO}_4, 4\text{H}_2\text{O}$. $\text{CdCl}_2, 2\text{H}_2\text{O}$. CdI_2 . CdBr_2 . Na_2CO_3 , white CdCO_3 . $\text{HCl} + \text{H}_2\text{S}$ light yellow CdS , soluble in HNO_3 and hot dilute $\text{H}_2\text{SO}_4, 2\text{H}_2\text{O}$. KOH , white $\text{Cd}(\text{OH})_2$. NH_4OH white $\text{Cd}(\text{OH})_2$, so soluble in excess, that no prec. if free acid present. $(\text{NH}_4)_2\text{CO}_3$ white CdCO_3 , soluble in KCN . K_4FeCy_6 , yellowish-white Cd_2FeCy_6 . K_6Fedy yellow-brown. On charcoal, in reducing flame, brownish incrustation of CdO . Cadmium is weighed as CdO containing 87.5 per cent. of metal.

11. **Bismuth oxide** Bi_2O_3 , yellow, fusible at red-heat. **HYDROXIDE**, white. Chief soluble salts: $\text{Bi}_3\text{NO}_3, 5\text{H}_2\text{O}$; BiCl_3 ; colorless, strongly acid. Water alone decomposes them, respectively, into $\text{Bi}_2\text{O}_3, \text{Bi}_3\text{NO}_3, 3\text{H}_2\text{O}$ and BiOCl , and the precipitate is increased by tartaric acid. Na_2CO_3 with effervescence, white basic carbonate. $\text{HCl} + \text{H}_2\text{S}$ dark brown Bi_2S_3 , soluble in HNO_3, KOH and NH_4OH white hydroxide. $\text{K}_2\text{Cr}_2\text{O}_7$, an orange precipitate of Bi_2CrO_4 soluble in HNO_3 . K_2SnO_3 a black precipitate. On charcoal with Na_2CO_3 , in reducing flame, gives beads of brittle reddish-white bismuth, with slight yellow incrustation. Bismuth is weighed as Bi_2O_3 , containing 89.74 per cent. of

metal. *N.B.* To metals precipitated by chlorides should be added **Bi**, in solutions of nitrate.

Lead oxide PbO. Lead sulphide **PbS**, blue-black, soluble in hot HNO_3 . Already given at p. 1, under heading of precipitates by **HCl**. But, in dilute solutions **HCl** occasions no precipitate, as PbCl_2 is soluble in much water. Indeed the solubility of PbCl_2 in water, renders it separable from insoluble Hg_2Cl_2 and **AgCl**. Both PbCl_2 and AgCl are soluble in **HCl**, but water precipitates **AgCl** again, soluble in NH_3 . If lead should be found in Group II. **B**, excess of dilute sulphuric acid will at once distinguish it from all the other metals of Groups I. and II. Further tests: **KI** and $\text{K}_2\text{Cr}_2\text{O}_7$; lead chromate soluble in **KOH**. Lead is weighed as lead sulphate PbSO_4 , containing 68.32 per cent. of metal.

12. **Cupric oxide CuO**, black; **HYDROXIDE Cu(OH)₂**, light-blue. Salts are colored, green or blue. Chief soluble salts: $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$; $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$; $\text{Cu}_2\text{NO}_3 \cdot 6\text{H}_2\text{O}$. Acid reaction, Na_2CO_3 , blue Cu(OH)_2 , CuCO_3 sol. with deep blue color in NH_3 , and to colorless solution in potassium cyanide. **HCl** changes blue sol. of CuSO_4 to green. **HCl** + H_2S brown-black prec. *slightly* soluble both in $(\text{NH}_4)_2\text{S}_2$, and even in H_2S . When large excess of mineral acid present, no prec. by H_2S until water added. **KOH** blue precipitate Cu(OH)_2 ; into black **CuO** when boiled. Glucose first added, and then **KOH** in excess, reduces **Cu** on heating to red cuprous oxide Cu_2O . NH_4OH , first a greenish-blue precipitate of basic salt; on excess, deep blue solution of $\text{CuSO}_4 \cdot 4\text{NH}_3 \cdot \text{H}_2\text{O}$. **KCNS**, together with K_2SO_3 precipitates white cuprie sulphocyanide. K_2Cfy , red-brown Cu_2Cfy , or coloration. K_2HASO_3 , green CuHASO_3 . Iron deposits **Cu**, especially in presence of free acid. On charcoal, with Na_2CO_3 , in inner flame, a bead of copper is obtained. Salts of copper, in inner flame, give emerald-green color: the chloride, azure-blue. Borax-bead, green whilst hot, blue when cold. Copper is estimated as cupric oxide, which contains 79.85 per cent. of metal. By means of $(\text{NH}_4)_2\text{CO}_3$ in excess, it is separated from **Bi** and **Cd**.

13. **Mercuric oxide HgO**; red or yellow-red,—black when heated, and volatilizing as $\text{Hg} + \text{O}$. Soluble salts colorless. Hg_2NO_3 , very acid. HgCl_2 , the chloride, or “corrosive sublimate,” faintly acid. Na_2CO_3 , heavy red-brown $2\text{HgO} \cdot \text{HgCO}_3$: no precipitate in mercuric cyanide. **HCl** separates **HCN**. **HCl** + H_2S , the latter slowly added, detects **Hg** by formation of first white chloro-sulphide, $2\text{HgS} \cdot \text{HgCl}_2$, then orange, black HgS , soluble in aqua regia. **KOH**, yellow HgO . NH_3 in Hg_2NO_3 , yellow HgO ; but in HgCl_2 , or in presence of NH_4Cl , white mercuric chloro-amide NH_2HgCl . **KI** scarlet HgI_2 , soluble in excess. SnCl_2 first Hg_2Cl_2 and then Hg_2 in grey globules. With metallic copper, **Hg** separated as silvery mirror, volatilized

by heat. Heated with Na_2CO_3 in glass tube, Hg volatilizes. Mercury may be weighed as mercury, as mercurous chloride, Hg_2Cl_2 , containing 84.92 per cent. of Hg , and as sulphide HgS containing 86.21 per cent. of metal.

14. Palladious oxide PdO , black. HYDROXIDE $\text{Pd}(\text{OH})_2$, dark-brown, by Na_2CO_3 from its salts. Salts mostly soluble. PdCl_2 , brown or reddish-brown; decomposed by heat. $\text{HCl} + \text{H}_2\text{S}$, black PdS , soluble in hot HCl . KOH , brown basic salt, soluble. NH_3 flesh-colored precipitate, soluble. KI black PdI_2 soluble. MERCURIC CYANIDE HgCy_2 , yellowish-white PdCy_2 soluble in NH_4OH : thus may Pd be separated from all the metals except lead and cuprum. On charcoal, with Na_2CO_3 the salts yield spongy Pd . Palladium is estimated as metal.

15. Ferric oxide Fe_2O_3 , red-brown. HYDROXIDE $\text{Fe}_2(\text{OH})_6$ bulky reddish-brown. Salts acid, yellow or yellow-red or red-brown. Na_2CO_3 with effervescence, hydroxide with carbonate. HCl deepens the color. $\text{HCl} + \text{H}_2\text{S}$ reduces ferric to ferrous salts, but sulphur of white or yellow color is alone precipitated. Thus: $\text{Fe}_2\text{Cl}_6 + n\text{HCl} + \text{H}_2\text{S} = 2\text{FeCl}_2 + 2\text{HCl} + n\text{HCl} + \text{S}$. If then a whitish or yellowish precipitate, add NH_4OH to one portion, and this with the H_2S present will form NH_4HS and throw down black $\text{FeS.H}_2\text{O}$; to the other portion, add potassium ferridcyanide: Turnbull's blue will result. Look for Ferric in Group III.

N.B. If $\text{HCl} + \text{H}_2\text{S}$ gives no reaction, add NH_4OH : there is no precipitate.—pass on to GROUP V.

Chromic acid CrO_3 , crimson, or red yellow, or yellow, when dilute. Deliquescent. Reddens litmus. Effervescence without precipitation, on addition of Na_2CO_3 , and color bright yellow. Chromates of alkalis soluble: acid salts turned to bright yellow chromates by Na_2CO_3 . $\text{HCl} + \text{H}_2\text{S}$ precipitates Sulphur from chromic acid, and changes the acid into a salt of chromic oxide with bluish-green color. (See chromic acid.) Solutions of Ferric chloride or acidulated potassium dichromate are excellent tests of the quality of solutions of hydrogen sulphide.

Group III. Metals (not precipitated by Hydrogen chloride, nor by hydrogen sulphide in acid solutions) precipitated in neutral solutions containing much ammonium chloride by ammoniac hydrate in excess, as hydroxides. 15. Ferric oxide Fe_2O_3 . 16. Manganic oxide Mn_2O_3 . 17. Aluminum oxide Al_2O_3 . 18. Chromic oxide Cr_2O_3 . [Glucinum oxide GO .]

15 bis. Ferric oxide Fe_2O_3 ; red-brown. HYDROXIDE $\text{Fe}_2(\text{OH})_6$, red-brown. Salts red-brown or yellow, very intense. Chief salts: Ferric chloride Fe_2Cl_6 . Ferric sulphate $\text{Fe}_2(\text{SO}_4)_3.9\text{H}_2\text{O}$. Ferric nitrate $\text{Fe}_2(\text{NO}_3)_6.12\text{H}_2\text{O}$. Acid reaction. Colored solu-

tions. Na_2CO_3 , red ferric hydroxide and basic carbonate; soluble in NaHCO_3 to red solution. HCl increases the reddish-yellow tinge. $\text{HCl} + \text{H}_2\text{S}$ reduces to Ferrous salt and precipitates yellow sulphur. Thus: $\text{Fe}_2\text{Cl}_6 + n\text{HCl} + \text{H}_2\text{S} = 2\text{FeCl}_2$ in solution $+ 2\text{HCl} + n\text{HCl} + \text{S}$. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$, red-brown ferric hydroxide $\text{Fe}_2(\text{OH})_6$. $(\text{NH}_4)_2\text{S}_2$ black $\text{Fe}_2\text{S}_3 \cdot 3\text{H}_2\text{O}$. KOH , red-brown hydroxide. NH_4OH , precipitates also hydroxide. K_4FeCy , precipitates prussian blue $\text{Fe}_4\text{Fe}_3\text{Cy}_{18} \cdot 2\text{H}_2\text{O}$. KCNS , gives blood-red solution. Tincture of galls produces blue-black ink. On charcoal, a dull-black powder attracted by magnet. Borax gives a bead varying in color from yellow to dark-red. Iron is weighed as Fe_2O_3 containing 70 per cent. of metal.

[16. Manganic oxide Mn_2O_3 , blackish-brown. Salts deep-red and decomposed by heat into salts of MnO .]

17. Aluminum oxide Al_2O_3 , white; HYDROXIDE $\text{Al}_2(\text{OH})_6$ white, gelatinous, soluble in KOH (in which ferric oxide is insoluble). Soluble salts colorless, and acid to test-paper (except in aluminates which are strongly alkaline, and precipitated at first by HCl). CHIEF SALTS: Potassium, Sodium and Ammonium ALUMS. E.g. $\text{K}_2\text{Al}_2\text{SO}_{24}\text{H}_2\text{O}$. ALUMINUM SULPHATE $\text{Al}_2\text{SO}_4 \cdot 18\text{H}_2\text{O}$: from its solution, K_2SO_4 precipitates alum. Na_2CO_3 , white gelatinous precipitate of $\text{Al}(\text{OH})_3$. $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_3$ white gelatinous hydroxide. KOH white $\text{Al}_2(\text{OH})_6$, soluble in excess. Na_2HPO_4 white aluminum phosphate, not soluble in acetic acid even when heated. $(\text{NH}_4)_2\text{S}_2$, white $\text{Al}_2(\text{OH})_6$ soluble in KOH . On charcoal heated strongly, and moistened with Co_2NO_3 and re-heated, yields Thénard's blue. Aluminum is weighed as alumina Al_2O_3 , containing 53.39 per cent. of metal.

18. Chromic oxide Cr_2O_3 , green. HYDROXIDE $\text{Cr}_2(\text{OH})_6$, blue-green, soluble in KOH to green solution. Salts have a violet or green color. Soluble salts redden litmus. Chief salt: CHROME ALUM $\text{K}_2\text{Cr}_2\text{SO}_{24}\text{H}_2\text{O}$. Na_2CO_3 , bluish grey-green basic carbonate, somewhat soluble. $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_3$ bluish-green $\text{Cr}_2(\text{OH})_6$ soluble with peach-blossom tint in very large excess. $(\text{NH}_4)_2\text{S}_2$ bluish-green $\text{Cr}_2(\text{OH})_6$, soluble with green color in KOH . KOH blue-green $\text{Cr}_2(\text{OH})_6$, soluble with emerald-green color, and again separable on boiling. If PbO_2 boiled with solution of $\text{Cr}_2(\text{OH})_6$ in KOH , yellow PbCrO_4 is obtained, which can be precipitated by neutralizing with acetic acid. Fused with Na_2CO_3 and KNO_3 , yellow chromate is obtained. The borax-bead is colored green; so is also microcosmic salt. Chromium is weighed as Cr_2O_3 , containing 68.63 per cent. of metal.

[19. Glucinum or Beryllium oxide GO , white; HYDROXIDE $\text{G}(\text{OH})_2$ flocculent, soluble in KOH , and re-precipitated on boiling. Displaces NH_3 slowly from its salts, and dissolves in

NH_4Cl as chlorido. Salts alkaline to test-paper. Na_2CO_3 white GCO_3 , considerably soluble. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{CO}_3$ no precipitate. KOH white hydroxide; soluble, but re-precipitated by NH_4Cl . $(\text{NH}_4)_2\text{S}_2$ white flocculent hydroxide. Oxalic acid and oxalates no precipitate. $(\text{NH}_4)_2\text{CO}_3$, white, soluble in excess.]

Group IV. Metals (not precipitated by HCl as are Pb , Hg_2 and Ag in Group I., nor by $\text{HCl} + \text{H}_2\text{S}$ as are As , Sb , Sn , Sn_2 , Au , Pt , Cd , Bi , Hg , Cu , Pd in Group II., nor by $(\text{NH}_4)_2\text{S}_2$, not as sulphides, but as hydroxides, as are Mn_2 , Fe_2 , Cr_2 , Al_2 , G) precipitated by $(\text{NH}_4)_2\text{S}_2$ in presence of ammonium chloride, as sulphides. Includes zinc, manganous, ferrous, cobaltous, nickel [uranous and uranic]. Zinc sulphide $\text{ZnS}, \text{H}_2\text{O}$ white. Manganous sulphide $\text{MnS}, \text{H}_2\text{O}$, flesh-colored. Ferrous sulphide $\text{FeS}, \text{H}_2\text{O}$, black. Cobaltous sulphide $\text{CoS}, \text{H}_2\text{O}$, black. Nickel sulphide $\text{NiS}, \text{H}_2\text{O}$ black. [Uranous sulphide US , black, and Uranic sulphide U_2S_3 yellowish-brown.]

20. Zinc oxide ZnO , white. HYDROXIDE $\text{Zn}(\text{OH})_2$, white and soluble in KOH . Soluble salts colorless. Chief salts; ZnSO_4 , $7\text{H}_2\text{O}$; ZnCl_2 ; acid to test-paper. Na_2CO_3 immediate white ZnCO_3 . $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_3$ no reaction, unless NH_4Cl in too small quantity, then white gelatinous hydroxide soluble in excess. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{S}_2$, white ZnS , H_2O soluble in HCl . KOH , white hydroxide, soluble. NH_4OH , white hydroxide, soluble; no precipitate in presence of free acids or ammoniacal salts. $(\text{NH}_4)_2\text{CO}_3$, white carbonate, soluble. K_4Fcy , white, gelatinous, Zn_2Fcy . K_6Fedy brownish-yellow. With Na_2CO_3 in reducing flame, the charcoal incrustated with yellow ZnO whilst hot, white on cooling. ZnO or salts strongly heated, and then moistened with Co_2NO_3 , on reheating green (Rinman's green). Zinc is weighed as ZnO , containing 80.24 per cent. of zinc.

21. Manganous oxide, MnO , light-green; HYDROXIDE white, browning on exposure to air. Soluble salts colorless, or pale pink. Neutral or faintly acid. Chief soluble salts; MnSO_4 , $7\text{H}_2\text{O}$ and $\text{MnCl}_2, 4\text{H}_2\text{O}$. Na_2CO_3 , white precipitate of MnCO_3 , H_2O . $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$ no precipitate, but the solution browns on exposure to air from formation of $\text{MnO}, \text{Mn}_2\text{O}_3$. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{S}_2$, flesh-colored precipitate of $\text{MnS}, \text{H}_2\text{O}$ browning on exposure, and soluble in HCl or HNO_3 . KOH , white $\text{MnO}, \text{H}_2\text{O}$ browning. NH_4OH , hydroxide, soluble in large excess, but easily in presence of ammoniacal salts. $(\text{NH}_4)_2\text{CO}_3$, white $\text{MnCO}_3, \text{H}_2\text{O}$ soluble in ammoniacal salts. K_4Fcy , reddish white Mn_2Fcy . K_6Fedy , brown Mn_3Fedy . On charcoal, or platinum with Na_2CO_3 , in the outer flame, green manganate. Borax-bead becomes amethystine on cooling, when heated in outer flame with manganese compounds. Micro-

oosmio salt, similar result. Mn is weighed as Mn_3O_4 , containing 72 per cent. of manganese.

22. Ferrous oxide FeO , black. HYDROXIDE $\text{Fe}(\text{OH})_2$ white, changing when moist into blue-green, and finally red. Salts more or less sea-green. Faintly acid. Chief salt: Ferrous sulphate $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$. Na_2CO_3 , whitish precipitate of FeCO_3 , when free from ferric salt: then more or less tinted. HCl changes color to yellow. $\text{HCl} + \text{H}_2\text{S}$ no reaction, except a ferric salt present. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$ no precipitate, but on exposure Ferrous-ferric hydrate of more or less red color begins to separate. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{S}_2$ black $\text{FeS} \cdot \text{H}_2\text{O}$, soluble in HCl or HNO_3 . KOH whitish hydroxide, immediately changing to blue or bluish-green, and slowly, on the surface to red. NH_4OH , whitish hydroxide, rapidly becoming bluish-green from absorption of oxygen, largely soluble in excess and not precipitate in presence of ammoniacal salts. K_4Cfy bluish-white $\text{K}_2\text{Fe}_2\text{Cfy}_2$, rapidly blueing. If ferric salt present, more or less blue. K_6Fedy , Turnbull's blue. KCNS no change, except ferric salt present. Charcoal test &c., see 15. Ferric oxide. Iron is weighed as Fe_2O_3 , containing 70 per cent. of ferrum. N.B. A ferrous salt is changed by HNO_3 or by aqua regia into a ferric salt, after which it is discovered and removed under Group III. by $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$.

23. Cobaltous oxide CoO , grey. HYDROXIDE $\text{Co}(\text{OH})_2$, dirty-red. Salts blue or red. Chief salts: $\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$; Co_2NO_3 , $6\text{H}_2\text{O}$; $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$. Acid to test-paper. Na_2CO_3 , lilac precipitate $3\text{CoO} \cdot 2\text{CoCO}_3 \cdot 4\text{H}_2\text{O}$. HCl may turn red salt blue. $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_3$, no precipitate, but reddish-brown on exposure. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{S}_2$, as black $\text{CoS} \cdot \text{H}_2\text{O}$, soluble in aqua regia. KOH blue basic salts, turning green on exposure, owing to absorption of oxygen: into pale-red hydroxide on boiling. NH_4OH , blue basic salt, readily soluble in excess, with greenish color, browning on exposure: ultimately red. $(\text{NH}_4)_2\text{CO}_3$, peach-colored basic carbonate, readily soluble with magenta color. K_4Cfy , greenish precipitate of Co_2Cfy . K_6Fedy brownish-red precipitate. Addition of tartaric acid, then of NH_4OH , and K_6Fedy , yields a deep yellowish-red color. Thus may Co be detected in presence of Ni. KNO_2 , together with acetic acid, yields after a time a bright-yellow precipitate of cobalt sesquioxide and potassium nitrite. KCN brownish-white CoCy_2 , easily soluble, and precipitated by HCl : not precipitated if cobalticyanide produced. On charcoal, similar to iron, but more metallic. Borax bead coloured blue both in inner and outer flame. Microcosmic salt, similar reaction. Cobalt is either weighed as metal, or as Co_3O_4 , containing 73.44 per cent. of metal.

24. Nickel oxide NiO , green. HYDROXIDE $\text{Ni}(\text{OH})_2$, unripe

apple-green. Soluble salts redden litmus. Chief soluble salts : $\text{NiCl}_2 \cdot 9\text{H}_2\text{O}$. $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$. $\text{Ni}_2\text{NO}_3 \cdot 6\text{H}_2\text{O}$. Green in color. Na_2CO_3 , green basic carbonate. $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_3$, plum-colored liquid. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{S}_2$ black sulphide $\text{NiS} \cdot \text{H}_2\text{O}$, giving brown coloration to liquid. Readily soluble in aqua regia. KOH precipitates apple-green hydroxide $\text{Ni}(\text{OH})_2$. NH_4OH , greenish turbidity, soluble to a plum-colored fluid. No precipitate in free acids, or in presence of salts of ammonium : KOH re-precipitates $\text{Ni}(\text{OH})_2$. $(\text{NH}_4)_2\text{CO}_3$, green carbonate, readily soluble to greenish-blue fluid. K_4Cfy , greenish-white Ni_2Cfy . K_6Fedy , yellowish-brown Ni_3Fedy . KCN , yellowish-green CoCy_2 , soluble with brownish-yellow color, and re-precipitated on addition of acids. On charcoal, reduced, as is the case with iron and nickel. Borax bead in outer flame reddish-yellow while hot, paler on cooling. Nickel is weighed as NiO , containing 78.67 per cent. of metal.

25. [Uranous oxide UO . HYDROXIDE $\text{U}(\text{OH})_2$, reddish-brown. Salts green. $(\text{NH}_4)_2\text{S}_2$ black US . KOH , blackish-brown hydroxide, changing to yellow from formation of uranic salt. NH_4OH acts similarly. Uranous salts absorb O , and are instantly changed into uranic by HNO_3 .]

26. [Uranic oxide U_2O_3 brick-red. HYDROXIDE $\text{U}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$, greenish-yellow. Salts yellow. Na_2CO_3 , yellow granular, soluble, double carbonates. $(\text{NH}_4)_2\text{S}_2$, yellowish-brown sulphide. NH_4OH yellow ammonium uranate. K_4Fcy , brown.]

Group V. Metals (not precipitated by HCl as are Ag , Pb and Hg_2 ,—nor by $\text{HCl} + \text{H}_2\text{S}$ as are As , Sn , Sn_2 , Sb , Au , Pt , Hg , Bi , Pb , Cd , Cu , Pd ,—nor by NH_4OH in presence of NH_4Cl as are Al_2 , Mn_2 , Fe_2 , Cr_2 and Be ,—nor by H_2S even in presence of NH_4Cl as are Fe , Co , Ni , Mn , Zn) which are precipitated by Na_2CO_3 as carbonates, soluble in free acids as respective salts. Barium, as carbonate BaCO_3 , and Strontium as carbonate SrCO_3 , Calcium as carbonate CaCO_3 , and Magnesium as carbonate MgCO_3 .

27. Barium oxide BaO , white. HYDROXIDE $\text{Ba}(\text{OH})_2$, white, and soluble in water. Its solution strongly alkaline, is precipitated white by the CO_2 of the breath as well as by Na_2CO_3 , and yields Ag_2O of grey-brown color, soluble both in HNO_3 and in NH_4OH . Further $\text{Ba}(\text{OH})_2$ is precipitated immediately by CaSO_4 .—Soluble salts colorless. Neutral. Chief salts : Ba_2NO_3 . $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$. HCl no reaction unless concentrated, and then of the salt, soluble in more water. $\text{HCl} + \text{H}_2\text{S}$ no reaction. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$ no reaction unless ammonia contains carbonate. $\text{NH}_4\text{Cl} + (\text{NH}_4)_2\text{S}_2$, no reaction, unless ammonium sulphate present in the latter. $(\text{NH}_4)_2\text{CO}_3$, white BaCO_3 . KOH , white hydroxide, in concentrated solutions. NH_4OH no reaction. CaSO_4 , immediate white precipitate of

BaSO₄: all soluble sulphates precipitate BaSO₄. **(NH₄)₂C₂O₄**, white BaC₂O₄, soluble in HCl. **Na₂HPO₄**, white BaHPO₄, very slightly increased by NH₄OH. **K₂Cr₂O₇**, yellow BaCrO₄, soluble in HCl, unless the test contains sulphate. **2HF, SiF₄**, almost colorless BaF₂, SiF₄. Soluble salts impart **greenish-yellow color to flame**. Insoluble must be moistened with HCl, and then heated. Barium is estimated as **BaSO₄** containing 65.66 BaO, insoluble in dilute acids and alkalies. BaCl₂ is insoluble in absolute alcohol: **SrCl₂** is soluble.

28. **Strontium oxide SrO**, white. **HYDROXIDE Sr(OH)₂**, white, soluble and alkaline. **Na₂CO₃** white SrCO₃: also precipitated white by the breath. **AgNO₃**, grey-brown Ag₂O, soluble in NH₃ and in HNO₃. Precipitated by **CaSO₄** on heating. Soluble salts (except SrCrO₄ which is yellow) neutral or faintly acid. Chief salts: **Sr₂NO₃, 5H₂O**. **SrCl₂, 6H₂O**, deliquescent. **(NH₄)₂CO₃**, white BaCO₃. **KOH** white Sr(OH)₂ soluble in boiling water. **NH₄OH** of course no reaction. **CaSO₄**, white **SrSO₄** on long standing, or immediate when heated. Soluble sulphates precipitate SrSO₄. Both Ba and Sr thus removed from solutions containing Ba, Sr, and Ca. **(NH₄)₂C₂O₄** white SrC₂O₄. Carmine color to flame. Strontium weighed as **SrSO₄**, containing 56.52 per cent. of SrO.

29. **Calcium oxide CaO**, white. **HYDROXIDE Ca(OH)₂**, white and soluble in 700 parts of cold and 1280 parts of boiling water. "Lime-water." Alkaline. Precipitated by the breath (CO₂), as well as by Na₂CO₃. **AgNO₃**, grey-brown Ag₂O, soluble in HNO₃ and in NH₄OH. Chief salts: **CaCl₂, 6H₂O**, deliquescent. **CaSO₄, 2H₂O** soluble in 400 water. **Ca₂NO₃, 4H₂O**. **Ca₂ClO₃**. (Chloride of lime 2CaOCl₂, dissolves as CaCl₂ + Ca₂ClO,—therefore two salts, and not given at the examinations.) **(NH₄)₂CO₃**, white CaCO₃. The test should be added very sparingly on account of the solubility of calcium bi-carbonate, which would be precipitated on boiling. **CaSO₄** of course no reaction, even on boiling: absence of barium and strontium salts. **H₂SO₄** in concentrated sols., white crystalline **CaSO₄, 2H₂O**; precipitate hastened by alcohol. **(NH₄)₂C₂O₄**, white CaC₂O₄, quite insoluble in acetic acid. This test is decisive, if absence of Ba and Sr proved by CaSO₄. Soluble salts, **yellowish-red color to flame**. Calcium is weighed as **CaCO₃**, containing 56 per cent. of CaO, or as **CaSO₄**, containing 41.18 of CaO.

30. **Magnesium oxide MgO**, white. **HYDROXIDE Mg(OH)₂**, alkaline, requiring 5142 parts of ice-cold, and 36,000 parts of boiling water. Chief salts: **MgSO₄, 7H₂O**. **MgCl₂, 6H₂O**. **Mg₂NO₃, 6H₂O**. **(NH₄)₂CO₃**, after a few moments, a constantly increasing white precipitate of basic magnesium carbonate. No precipitate in presence of free acids, or of salts of ammonium. **NaHCO₃**, a precipitate on heating: a Mg salt therefore a test

for a bi-carbonate. NH_4OH , white hydroxide, slowly and incompletely: in presence of ammoniacal salts or of free acids, *no precipitate*. NaHPO_4 , added to a solution containing $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$, an immediate white crystalline $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$. KOH , NaOH , LOH , $\text{Ba}(\text{OH})_2$, $\text{Sr}(\text{OH})_2$ and $\text{Ca}(\text{OH})_2$, precipitate $\text{Mg}(\text{OH})_2$. $(\text{NH}_4)_2\text{C}_2\text{O}_4$ no precipitate at all (except in very concentrated solutions after a time). No color to flame: MgO , rose-colored when ignited on platinum with Co_2NO_3 . Magnesia is weighed as MgO , containing 60 per cent. of Mg , and as $\text{Mg}_2\text{P}_2\text{O}_7$, containing 36.21 per cent. of MgO .

Group VI. Metals not precipitated by Na_2CO_3 , nor by any of the preceding tests. Include kalium, natrium, lithium, caesium, rubidium, and ammonium.

31. Ammonium hydroxide NH_4OH only known in solution. Evolves NH_3 as a gas of ammoniacal (!) odor, blueing red litmus, and forming white fumes of NH_4Cl with a glass rod steeped in HCl . No residue on platinum. AgNO_3 grey-brown Ag_2O , easily soluble. No effervescence, when diluted, on addition of HCl . Nessler's test, yellow or brown $\text{NH}_2\text{I} \cdot \text{H}_2\text{O}$. With $2\text{HCl} + \text{PtCl}_4$, yellow $2\text{NH}_4\text{Cl} \cdot \text{PtCl}_4$. Salts: all soluble, except $2\text{NH}_4\text{Cl} \cdot \text{PtCl}_4$ and with difficulty ammonium hydrogen tartrate. Chief salts. NH_4Cl . $(\text{NH}_4)_2\text{SO}_4$. NH_4NO_3 . NH_4NO_2 . $2[(\text{NH}_4)_2\text{CO}_3] \cdot \text{CO}_2$. Solutions neutral, alkaline or acid. Na_2CO_3 boiled with any salt of ammonium, even when quite neutral or acid, evolves ammonium carbonate, smells of NH_3 , fumes with HCl and blues red litmus. KOH , $\text{Ca}(\text{OH})_2$ and all intermediate hydroxides displace NH_3 which is recognized as above. PtCl_4 , yellow $2\text{NH}_4\text{Cl} \cdot \text{PtCl}_4$. Salts volatilized by heat, with or without decomposition. Fixed acids remain.

32. Potass-oxide K_2O , grey. HYDROXIDE KOH , white, fusible, partially volatile, with violet color to flame. Strongly alkaline. Na_2CO_3 no reaction, even on boiling (absence of NH_4 salts). AgNO_3 grey-brown Ag_2O , insoluble in excess. Nearly all salts soluble, except $2\text{KCl} \cdot \text{PtCl}_4$ and $2\text{KF} \cdot \text{SiF}_4$. Chief salts: K_2CO_3 , $2\text{H}_2\text{O}$. KHCO_3 . K_2SO_4 . KCl . KClO_3 . KI . KBr . Solutions colorless, except in the case of chromates (yellow), dichromates (yellow-red), ferrocyanide (yellow), &c. &c. Na_2CO_3 no reaction, even on boiling. After proving absence of NH_4 salts: $\text{HCl} + \text{PtCl}_4$, yellow $2\text{KCl} \cdot \text{PtCl}_4$, nearly insoluble in alcohol-ether. Stirring promotes the precipitation. Concentration in dilute solutions necessary. Tartaric acid $\text{H}_2\text{C}_4\text{H}_4\text{O}_6$, in excess, white crystalline $\text{KHC}_4\text{H}_4\text{O}_6$, soluble in alkalis, and in acids. $2\text{HF} \cdot \text{SiF}_4$, nearly white $2\text{KF} \cdot \text{SiF}_4$. The violet tint of flame best observed through blue glass.

33. Lithium oxide Li_2O , white. HYDROXIDE LOH , white, least soluble of alkalis. Alkaline. Chief salt: LiCl , deliques-

eent. $2\text{HCl}, \text{PtCl}_4$ no precipitate. $\text{H}_2\text{C}_4\text{H}_4\text{O}_6$ no precipitate. In concentrated solutions Na_2CO_3 white Li_2CO_3 : in dilute, none. Na_2HPO_4 , white Li_3PO_4 , soluble in dilute acids. In blowpipe flame, a purplish red color.]

[34. Rubidium oxide Rb_2O , white. HYDROXIDE RbOH , white, very soluble, alkaline. Resembles KOH , but more electropositive. RbCl , very deliquescent. Na_2CO_3 no reaction. $2\text{HCl} + \text{PtCl}_4$, very sparingly soluble $2\text{RbCl}, \text{PtCl}_4$. Flame violet.]

[35. Caesium oxide. Cs_2O white. HYDROXIDE CsOH white, deliquescent, strongly alkaline. Na_2CO_3 no reaction. $2\text{HCl} + \text{PtCl}_4$ yellow $2\text{CsCl}, \text{PtCl}_4$. Flame violet.]

36. Sodium oxide Na_2O : grey. HYDROXIDE NaOH white, very deliquescent, alkaline, partially volatile. Yellow color to flame. Na_2CO_3 , of course no reaction. AgNO_3 , grey-brown Ag_2O , soluble in NH_4OH and in HNO_3 . Salts all soluble, except $\text{Na}_2\text{H}_2\text{Sb}_2\text{O}_7$, which is precipitated by $\text{K}_2\text{H}_2\text{Sb}_2\text{O}_7$.

Recapitulation.

GROUP I. HCl gives a precipitate. PbCl_2 . Hg_2Cl_2 . AgCl . (TiCl). 1. PbCl_2 soluble in boiling water. KOH white $\text{Pb}(\text{OH})_2$, soluble. 2. Hg_2Cl_2 , insoluble, black by NH_3 as $\text{NH}_2\text{Hg}_2\text{Cl}$. KOH black Hg_2O . 3. AgCl insoluble, dissolved in excess of NH_3 , and re-precipitated by HNO_3 . KOH , grey-brown Ag_2O .

GROUP II. $\text{HCl} + \text{H}_2\text{S}$ a precipitate. Includes As , Sn_2 , Sn , Sb , Pt , Au , Cd , Bi , Pb , Cu , Hg and Pd .

A. Sulphides soluble in ammonium sulphide.

As_2S_3 . SnS_2 . SnS as SnS_2 . Sb_2S_3 . [PtS_2 . Au_2S_3 .]

As_2S_3 is immediately precipitated as bright yellow As_2S_3 , soluble in $(\text{NH}_4)_2\text{CO}_3$; as arsenite, gives yellow Ag_3AsO_3 and green CuHAsO_3 . An arsenate, with difficulty as $\text{As}_2\text{S}_3 + \text{S}_2$, soluble in $(\text{NH}_4)_2\text{CO}_3$. Ag_3AsO_4 liver-brown. $\text{NH}_4\text{MgAsO}_4$, $6\text{H}_2\text{O}$ white, crystalline. 5. $\text{SnS}_2, \text{H}_2\text{O}$ is yellow, insoluble in $(\text{NH}_4)_2\text{CO}_3$. In salts, Na_2CO_3 white pr. 7. $\text{SnS}, \text{H}_2\text{O}$ is coffee-brown, soluble by heat in $(\text{NH}_4)_2\text{S}_2$, and re-precipitated by HCl as yellow $\text{SnS}_2, \text{H}_2\text{O}$. 6. Sb_2S_3 orange-colored, soluble in strong HCl , insol. in $(\text{NH}_4)_2\text{CO}_3$.

B. Insoluble in $(\text{NH}_4)_2\text{S}_2$.

CdS . Bi_2S_3 . PbS . CuS . HgS . [PdS .]

10. CdS bright light yellow. Hydroxide soluble in NH_4OH . 11. Bi_2S_3 , dark-brown. BiO_2H , white, insol. in KOH and in NH_4OH . Chromate, orange. insol. in KOH . PbS , blue-black. $\text{Pb}(\text{OH})_2$ sol. in KOH . PbCrO_4 yellow, sol. in KOH . Dilute

sulphuric acid, white PbSO_4 . 12. CuS brown-black. Salts blue or green. NH_4OH deep-blue in excess. K_4Cfy red-brown Cu_2Cfy . 13. HgS black insol. in HNO_3 : carefully prec. by H_2S , white, yellow, orange, black. KI scarlet. SnCl_2 gives Hg_2Cl_2 and 2Hg .

GROUP III. In presence of NH_4Cl , by NH_4OH as hydroxides. $\text{Fe}_2(\text{OH})_6$; $[\text{Mn}_2(\text{OH})_6]$; $\text{Al}_2(\text{OH})_6$; $\text{Cr}_2(\text{OH})_6$. [BeO or GO]. 15. $\text{Fe}_3(\text{OH})_6$, red-brown, bulky, insol. in KOH . K_4Cfy , Prussian-blue. $(\text{NH}_4)_2\text{S}_2\text{Fe}_2\text{S}_3 \cdot 3\text{H}_2\text{O}$ black. 17. $\text{Al}_2(\text{OH})_6$, white, soluble in KOH . Salts colorless. 18. $\text{Cr}_2(\text{OH})_6$, bluish-green, soluble with emerald-green color in KOH .

GROUP IV. Even in presence of NH_4Cl , $(\text{NH}_4)_2\text{S}_2$ precipitates as sulphides ZnS , MnS , FeS , CoS , NiS , [$\text{US. U}_2\text{S}_3$]. 20. ZnS , H_2O , white, insoluble in KOH . $(\text{NH}_4)_2\text{CO}_3$, white. KOH , white. NH_4OH white, soluble without color. 21. $\text{MnS} \cdot \text{H}_2\text{O}$, flesh-color, browning, sol. in acetic acid even. KOH white, insoluble, browning. NH_4OH , white, sol. browning. 22. $\text{FeS} \cdot \text{H}_2\text{O}$, black, very soluble in HCl . K_6Fedy , Turnbull's blue. K_4Cfy bluish-white. 23. $\text{CoS} \cdot \text{H}_2\text{O}$, black, insoluble in weak HCl . Solutions pink, red or blue,—on dilution pink. NH_4OH in excess to reddish-brown liquid. Na_2CO_3 lilac precipitate. K_6Fedy brownish-red. K_4Cfy greenish. 24. $\text{NiS} \cdot \text{H}_2\text{O}$, black, with difficulty soluble in HCl . Solutions green. NH_4OH in excess, plum-colored solution. K_6Fedy yellowish-brown. K_4Cfy greenish-white.

GROUP V. Metals precipitated as carbonates by Na_2CO_3 . BaCO_3 . SrCO_3 . CaCO_3 . $\text{Mg}(\text{OH})_2$, MgCO_3 .

A. $(\text{NH}_4)_2\text{CO}_3$ precipitates Ba , Sr and Ca .

27. BaCO_3 , white. CaSO_4 , immediate pr. of BaSO_4 . Yellow-green color to flame. 2HF , SiF_4 white precipitate. 28. SrCO_3 , white. CaSO_4 a precipitate after standing or on heating. Crimson color to flame. 29. CaCO_3 white. CaSO_4 no reaction. $(\text{NH}_4)_2\text{C}_2\text{O}_4$ white, insoluble in acetic acid.

B. $(\text{NH}_4)_2\text{CO}_3$ no precipitate, Mg .

30. MgCO_3 , white. NH_4OH white $\text{Mg}(\text{OH})$: no prec. in acid solutions. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$ no prec. but on addition of Na_2HPO_4 , white, crystalline $\text{NH}_4\text{MgPO}_4 \cdot 6\text{H}_2\text{O}$.

GROUP VI. Potassium group, including NH_4 , K , L , Rb , Cs , and Na .

31. NH_4OH , alkaline, odorous of hartshorn, blues red litmus and fumes with HCl . Salts decomposed by Na_2CO_3 . Volatile. PtCl_4 , yellow $2\text{NH}_4\text{Cl} \cdot \text{PtCl}_4$. 32. K looked for when absence of NH_4 salt proved. Violet color to flame. PtCl_4 yellow 2KCl , PtCl_4 . 36. Na . Salts: yellow color to flame. Only precipitated by $\text{K}_2\text{H}_2\text{Sb}_2\text{O}_7$.

Examination for acids.

Organic acids and salts, except oxalates, acetates and formates, blacken on heating. Nearly all salts of Group VI. are soluble in water. The nitrates, chlorates, sulphates, chlorides, bromides, iodides, cyanides and acetates are mostly soluble in water. It is advisable to moisten a solid with $(\text{NH}_4)_2\text{S}_2$ to ascertain at once the "suspicion" of metals belonging to Groups I., II., III., and IV. The condition as to "neutral," "alkaline," or "acid" is of first importance, and so is also the effect of heating on platinum. As with the bases, so with the acids: there are certain **Group-tests**, but they are not so definite. Students should carefully notice the amount of a precipitate, whether copious, scanty, or a mere turbidity, so as not to mistake mere traces for a substance present in quantity. When a solution is very dilute, it is advantageous to concentrate by evaporation. If Na_2CO_3 has produced a precipitate, continue the addition till a slight excess is present (alkaline and no further precipitate), warm, filter, neutralize the filtrate carefully with HCl or HNO_3 (*not forgetting the addition of these acids*); examine the filtrate for the acids. The precipitate of carbonate or hydroxide may be washed with distilled water, dissolved in HCl or HNO_3 , and tested for the metal. Further, in testing for organic acids the solution, if not neutral, should be made so by careful addition of dilute ammonia, or of dilute HCl , HNO_3 , or acetic acid: excess of NH_3 is removed by boiling. Many of the heavy metals are best removed by H_2S in excess, and filtration.

In the analysis of simple solutions, which is alone required in the Examinations of the University of London, of the Royal College of Physicians, and of Apothecaries Hall, these difficulties do not occur. The acids and salts in brackets and unnumbered are not there required.

A. Salts visibly or detectably decomposed by HCl . Includes carbonates, sulphides, sulphites, thiosulphates, [hydrosulphites, dithionates, trithionates, tetrathionates, pentathionates, sulphocarbonates] nitrites, chlorates, hypochlorites, [iodates, bromates, hypobromites] cyanides, ferrocyanides, ferricyanides, sulphocyanides, acetates, oxalates, silicates, [titanates, tungstates, molybdates] borates, chromates, arsenites, [sulpharsenites], arsenates, [sulpharsenates, antimonites, antimonates], urates, hippurates, gallates, tannates, benzoates [salicylates].

I. Carbonates: those of the alkaline metals alone soluble. Solutions colorless: alkaline to test-paper. Hydrogen-carbonates slightly alkaline. All bi-carbonates somewhat soluble, lose CO_2 when heated, and in the case of earthy carbonates

deposit insoluble carbonates. HCl , effervescence from inodorous CO_2 , which can be decanted into a test-glass containing lime-water and yields precipitate of CaCO_3 . BaCl_2 white BaCO_3 , soluble, with effervescence, in HCl or HNO_3 . AgNO_3 , white Ag_2CO_3 , sol., with effervescence, in HNO_3 , and soluble in NH_3 . CaCl_2 white CaCO_3 . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$ precipitates, "white-lead" $\text{Pb}(\text{OH})_2$, 2PbCO_3 . Bi-carbonates, like NaHCO_3 , only precipitate MgSO_4 on heating, and give a dull-red prec. with HgCl_2 ; carbonates an immediate prec. with MgSO_4 , and a yellow one with HgCl_2 . On heating NaHCO_3 , CO_2 is given off, and therefore a solution for testing can only be made in cold water. CaCO_3CO_2 , precipitated on boiling. Solution of H_2CO_3 , turns litmus, "port-wine-red," evolves pearly bubbles on warming, prec. lime-water and leaves no residue.

II. Sulphides. Odorous of H_2S . Alkaline to test-paper: no sulphide can be present that does not turn red litmus blue. Those of Groups V. and VI. alone soluble in water. HCl evolves H_2S , which blackens lead-paper: in poly-sulphides S is precipitated at same time as H_2S evolved, the latter even with effervescence, odorous of putrid eggs. (In testing for AsH_3 or SbH_3 , in putrid solutions, by paper soaked in AgNO_3 , lead paper must first be used to prove absence of H_2S .) AgNO_3 , black Ag_2S . FeSO_4 , black FeS . SnCl_4 , yellow $\text{SnS}_2\cdot 2\text{H}_2\text{O}$, soluble in excess of the sulphide. Free H_2S , recognized by odor, acid to test-paper, no reaction with HCl , no residue on heating. Cl prec. S ; Br and I water are decolorized, with deposit of S and formation of HCl , HBr and HI . HNO_3 decomposes H_2S , and sulphides, with deposit of S . As the quality of H_2S solution is of great importance in testing, it should be added in excess to solution of $\text{K}_2\text{Cr}_2\text{O}_7$ into which H_2SO_4 has been introduced: it should become milky blue-green. $2\text{K}_2\text{Cr}_2\text{O}_7 + 8\text{H}_2\text{SO}_4 + 6\text{H}_2\text{S} = 2\text{K}_2\text{Cr}_2\text{SO}_4 + 14\text{H}_2\text{O} + 3\text{S}_2$.

III. Sulphites. Sulphites of alkalis alone soluble: the neutral are alkaline to test-paper, the acid salts are all somewhat soluble, redden litmus, and then bleach it. HCl evolves odor of burning brimstone, but SO_2 so soluble, that effervescence rare. (N.B. The pungent odor of HCl might be mistaken for SO_2 : in case of doubt, use H_2SO_4 .) Add Zn to HCl solution, H_2S evolved. BaCl_2 white BaSO_3 , sol. in HCl in absence of sulphates,—a very rare case. AgNO_3 white Ag_2SO_3 ; by heat into grey metallic silver, often with silver lustre. $\text{Ag}_2\text{SO}_3 + \text{H}_2\text{O} = \text{H}_2\text{SO}_4 + \text{Ag}_2$. Ferric salts reduced to Ferrous: $\text{Fe}_2\text{Cl}_6 + \text{SO}_2 + 2\text{H}_2\text{O} = \text{FeSO}_4 + \text{FeCl}_2 + 4\text{HCl}$. Arsenic acid reduced to Arsenious acid: $\text{H}_3\text{AsO}_4 + \text{H}_2\text{SO}_3 = \text{H}_3\text{AsO}_3 + \text{H}_2\text{SO}_4$. Solution of SULPHUROUS ACID, H_2SO_3 is odorous of burning brimstone, reddens and bleaches litmus, bleaches indigo and other colors; decomposes H_2S , with deposit of S . On platinum no residue.

IV. Thiosulphates. Salts of alkalis, of Ca and Sr soluble; alkaline to test-paper. $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$, the common salt, **HCl** evolves SO_2 , and in a few moments a yellow prec. of **S**. Thus:— $\text{Na}_2\text{S}_2\text{O}_3 + 2\text{HCl} = 2\text{NaCl} + \text{H}_2\text{O} + \text{SO}_2 + \text{S}$. **AgNO₃**, white $\text{Ag}_2\text{S}_2\text{O}_3$, rapidly orange and black: $\text{Ag}_2\text{S}_2\text{O}_3 + \text{H}_2\text{O} = \text{H}_2\text{SO}_4 + \text{Ag}_2\text{S}$. **Hg₂NO₃**, black Hg_2S . **AgCl** readily soluble as NaAgS_2O_3 . **BaCl₂** white BaS_2O_3 . $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ fuses on platinum, evolves SO_2 , burning with yellow flame, with blue and red tints on platinum: at last into Na_2SO_4 . THIOSULPHURIC ACID non-existent in separate state.

[Hyposulphites, the real hydrosulphites. The free acid is a yellow liquid, HYPOSULPHUROUS ACID H_2SO_2 , easily decomposing with liberation of Sulphur. Salts white or colorless, give immediately black Ag_2S , with **AgNO₃**. **HCl** gives yellow color, and after a time $\text{S} + \text{SO}_2$. They bleach vegetable colors more rapidly than other sulphur-acids.]

[Dithionates. DITHIONIC ACID $\text{H}_2\text{S}_2\text{O}_6$, colorless liquid, by concentration into $\text{H}_2\text{SO}_4 + \text{SO}_2$. **HCl** into $\text{H}_2\text{SO}_4 + \text{SO}_2$. All salts soluble.]

[Trithionates. TRITHIONIC ACID $\text{H}_2\text{S}_3\text{O}_6$. Salts mostly soluble. **HCl** into $\text{H}_2\text{SO}_4 + \text{SO}_2 + \text{S}$. **AgNO₃** yellow. Hg_2NO_3 black. Hg_2NO_3 white.]

[Tetrathionates. TETRATHIONIC ACID $\text{H}_2\text{S}_4\text{O}_6$: very unstable. **HCl** into $\text{H}_2\text{SO}_4 + \text{SO}_2 + \text{S}_2$. **Hg₂NO₃**, yellow.]

[Pentathionates. PENTATHIONIC ACID $\text{H}_2\text{S}_5\text{O}_6$, acid liquid, by **HCl** into $\text{H}_2\text{SO}_4 + \text{H}_2\text{S} + 2\text{S}_2 + 4\text{SO}_2$. Iodine water not decolorized.]

[Sulphocarbonates, analogous to carbonates. SULPHOCARBONIC ACID H_2CS_3 . **HCl**, deep-brown oil H_2CS_3 separates. Boiled with water, the sulphocarbonates become carbonates.]

V. Nitrites. Mostly soluble. Nitrites of K, Na and NH_4 , alkaline, colorless. **HCl** evolves nitrous fumes (really $\text{NO} + \text{O} = \text{NO}_2$) of orange color, HNO_3 being found in solution. **AgNO₃** white AgNO_2 , black on heating. **FeSO₄**, olive-brown color, and NO_2 gas; to rich yellow color on heating. **CuSO₄**, emerald-green solution of Cu_2NO_2 . Starch-paste and **KI**, with acetic acid even, blue iodide of starch.

For action of **HCl** upon nitrates and nitric acid, see XXXVII.

VI. Chlorates. All soluble: no precipitate with reagents, except of the distinctive basyl. **HCl** evolves euchlorine as green-yellow gas, coloring the solution yellow-green. On platinum, into chlorides; then, dissolved in water, acidulated with HNO_3 and **AgNO₃** added, white, curd-like **AgCl**, soluble in NH_3 and insoluble in HNO_3 . Deflagrate on charcoal.

VII. Hypochlorites. "Bleaching-powder" 2CaOCl_2 , the chief salt: dissolves as mixture of $\text{CaCl}_2 + \text{Ca}_2\text{ClO}$. Alkaline also very soluble. Odor of Cl_2 ; bleach vegetal colors. **HCl** gives

either HOCl or $\text{Cl}_2 + \text{H}_2\text{O}$. Boiled, into chloride and chlorate. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white, and on warming red and brown PbO_2 . MnCl_2 , black $\text{MnO}(\text{OH})_2$.

[Iodates. Acid: HIO_3 . Alkaline salts soluble, colorless. Deflagrate on charcoal. On platinum into iodides (soluble in water, and scarlet HgI_2 with HgCl_2). HCl brown I_2 : soluble in chloroform with amethystine color, and giving with starch, blue iodide. BaCl_2 , white Ba_2IO_3 , soluble in HNO_3 . AgNO_3 , white AgIO_3 , soluble in NH_3 . H_2SO_3 reduces to iodide.]

[Bromates. Acid: HBrO_3 . Colorless: alkaline salts readily soluble. Deflagrate on charcoal. On Platinum into bromides (p. 39). HCl and heat, orange vapors or blood-red drops in test-tube, soluble with orange color in CHCl_3 , and forming orange bromide of starch. AgBrO_3 white. Hg_2BrO_3 , white.]

[Hypobromites. Acid: HOBr . Reactions like bromates, but they bleach, and the soluble salts have always alkaline reactions.]

VIII. Cyanides. Soluble salts colorless. Alkaline to test-paper. Odorous of hydrocyanic acid CNH . HCl liberates CNH freely, volatile, precipitating AgNO_3 . Chief salt: CNK , often containing K_2CO_3 , when solution effervesces with HCl . BaCl_2 no reaction (in absence of K_2CO_3 and KCNO). AgNO_3 white, curd-like AgCN , soluble in boiling HNO_3 , and in much NH_3 . AgCN fuses; by heat gives $(\text{CN})_2$, burning with peach-blossom colored flame. FeSO_4 red precipitate $\text{KCy}_{12}\text{FeCy}_2$: add KOH , boil and then HCl in excess "Prussian blue" $\text{Fe}_4\text{Fe}_3\text{Cy}_{18}, 18\text{H}_2\text{O}$ is formed. If only a trace, solution green. $(\text{NH}_4)_2\text{S}_2$ added and evaporated to dryness, leaves a sulphocyanide which gives blood-red coloration with Fe_2Cl_6 . Free CNH completely volatile; acid; odor as of peach-kernels bruised. No residue on platinum. AgNO_3 white AgCN , sol. in boiling HNO_3 . A strip of filtering paper, moistened with KOH , and suspended in tube where CNH escapes, gives "Prussian blue" reaction when placed in solution of FeSO_4 , and HCl added. N.B. In HgC_2N_2 , Hg not precipitated by Na_2CO_3 ; but HCl sets CNH free. Heated in tube, HgC_2N_2 gives Hg and C_2N_2 , which burns with peach-blossom colored flame.

IX. Ferrocyanides. Chief salt $\text{K}_4\text{FeCy}_6, 3\text{H}_2\text{O}$. Slightly alkaline. Yellow. HCl , precipitates white or bluish-white H_4FeCy_6 : in weak solutions no visible reaction, but probably blue tint. AgNO_3 white. CuSO_4 , red-brown Cu_2Cfy . Fe_2Cl_6 , Prussian blue $\text{Fe}_4\text{Fe}_3\text{Cy}_{18}, 18\text{H}_2\text{O}$. FeSO_4 bluish-white $\text{K}_2\text{Fe}_2\text{Cy}_6$. Heated on platinum, cyanide formed. Test as under VIII. Distilled with dilute sulphuric acid, they yield CNH in the distillate.

X. Ferricyanides. Chief salt $\text{K}_3\text{Fe}_2\text{Cy}_{12}$: neutral, brownish-

green in color. **HCl** no visible reaction. **AgNO₃** orange, insoluble in **HNO₃**, but readily in **KCN** and in **NH₃**. **Fe₂Cl₆**, only deepens the brown tinge. **FeSO₄**, "Turnbull's blue." Distilled with **H₂SO₄**, they yield **CNH**. Both the insoluble ferrocyanides and ferrieyanides are decomposed by boiling with **NaOH**, into the respective oxides, and soluble **Na₄Cfy** or **Na₆Fedy**. By fusion with **KNO₃**, **CO₂** and **N** are evolved, and the respective metals obtained as oxides.

XI. Sulphocyanides. Chief salts: **KCNS** and **NH₄CNS**. Slightly alkaline. Colorless. **HCl** no visible reaction. **AgNO₃** white, soluble in **NH₃**, not in dilute **HNO₃**. **Pb₂C₂H₃O₂**, white, very soluble in acetic acid. **CuSO₄**, black **CuCsy₂**: in presence of **FeSO₄** or **H₂SO₃**, white **Cu₂Csy₂**. **Fe₂Cl₆**, blood-red **Fe₂Csy₆**: color destroyed by **HgCl₂**; not by **HCl**. **Zn** + **H₂SO₄**, evolves **H₂S** and decolorizes.

XII. Acetates. With **HCl**, by heat evolve acetic acid (see D. p. 37).

XIII. Oxalates (see C. p. 35).

XIV. Silicates. Salts of alkaline metals alone soluble, colorless, alkaline. **HCl** gelatinous **H₄SiO₄** deposited. In dilute solutions no visible reaction, as ortho-silicic acid remains dissolved; on evaporation to dryness, heating, and boiling with dilute **HCl**, **SiO₂** is left as a white, amorphous, insoluble substance. **NH₄Cl**, white **H₄SiO₄**, with odor of **NH₃**. **BaCl₂**, white. **AgNO₃**, white. (A dialysed solution is gelatinized by **HCl**, and is only faintly acid to test-paper.)

[Titanic acid, which resembles **SiO₂**, is separated from **SiO₂** by fusion with **KHSO₄**, and subsequent treatment with water, **SiO₂** remains undissolved.]

[Tungstates of alkalis and magnesia alone soluble. Sols. colorless, alkaline. **HCl** white gelatinous **H₂WO₄**, turning yellow on boiling, and insoluble in excess of **HCl**, of **HNO₃** and of **H₂SO₄**; soluble in ammoniac hydrate. **(NH₄)₂S₂** + **HCl** brown **WS₃**. **SnCl₂** yellow; **HCl** and heat blue coloration. **BaCl₂**, white. **AgNO₃** white. **HCl** + **Zn**, blue coloration from reduction. **H₂WO₄** is lemon-colored, insoluble in water.]

[Molybdates of alkalis soluble. Colorless. **HCl** white **MoO₃**, soluble in excess of **HCl**, of **HNO₃** and of **H₂SO₄**. Alkaline salts, yellow color by **H₂S**, and pree. brown-black by acids, **MoS₃**, soluble in **(NH₄)₂S₂**. In **HCl** solution with **Zn** or **Sn**, blue, green, black. Solution of molybdate of ammonium dissolved in **HNO₃**, gives yellow precipitate in neutral or acid phosphates: a test for phosphates.]

XV. Borates. Boracic acid **B(OH)₃**, and "borax" **Na₂B₄O₇**, **10H₂O**, the commonest. Salts of alkalis, soluble, colorless, alkaline, fusible. All borates somewhat soluble; easily in acids, and ammonium salts. **HCl** in concentrated sols. white,

crystalline $B(OH)_3$, readily soluble in excess or in water. $BaCl_2$ white, soluble in acids. $CaCl_2$ white, sol. in acetic acid or NH_4Cl . Moistened with HCl or H_2SO_4 on platinum, green color to flame. $B(OH)_3$, fuses, gives green color to flame. Turmeric browned. In the case of a borate, add HCl , then turmeric paper; on drying, the latter red-brown, and the red stain blued by soda.

XVI. Chromates of alkalis soluble; yellow or yellow-red. $K_2Cr_2O_7$ reddens litmus. Na_2CO_3 with effervescence, acid to yellow neutral chromate, without precipitation. HCl , deepens the color to red. H_2SO_4 needles of CrO_3 , crimson, in concentrated solutions. HCl , heated, evolves Cl_2 and reduces. $HCl + H_2S$, to blue-green Cr_2Cl_6 with deposit of S. (See H_2S .) $AgNO_3$, crimson Ag_2CrO_4 , soluble in ammonia and in nitric acid. $PbC_2H_3O_2$, yellow $PbCrO_4$, soluble in KOH . $BaCl_2$ yellow $BaCrO_4$. $CaCl_2$ no reaction. Bi_3NO_3 orange-yellow Bi_2CrO_4 .

XVII. Arsenites (p. 14). Alkaline alone soluble; turn red litmus blue. HCl in conc. sols. white As_2O_3 , sol. in excess, and precipitated by H_2S as yellow As_2S_3 . $CuSO_4$ green $CuHASO_3$, sol. with blue color in NH_3 . $AgNO_3$, yellow Ag_3AsO_3 , very soluble in NH_3 and in HNO_3 and in ammoniacal salts. (DR. ALFRED S. TAYLOR'S method of distilling insoluble arsenical compounds with strong HCl is turned to good account with Scheele's Green: the distillate contains $AsCl_3$, precipitable as yellow As_2S_3 by H_2S .)

[Sulpharsenites. K_3AsS_3 , alkaline, yellow. With HCl gives H_2S and yellow As_2S_3 .]

XVIII. Arsenates (p. 15). $Na_2HASO_4 \cdot 12H_2O$, chief soluble salt. Soluble alkaline or acid; colorless. HCl no visible reaction. $HCl + H_2S$ no reaction till evaporated nearly to dryness: then H_2S yellow $As_2S_3 + S_2$ soluble in NH_4OH . $AgNO_3$ liver-brown Ag_3AsO_4 . $CuSO_4$ in arsenates, greenish-blue $CuHASO_4$: no pr. in free acid. $BaCl_2$ white $BaHASO_4$. $MgSO_4$ with NH_4OH in presence of ammoniacal salts, white, crystalline $NH_4MgPO_4 \cdot 6H_2O$. (Some arsenates, such as ferric arsenate, give no distinct mirror with Na_2CO_3 and charcoal.) Reimsch's test and Marsh's test apply to As_2O_3 and As_2O_5 .

[Sulpharsenates. K_3AsS_4 , colorless, alkaline. HCl gives H_2S and yellow As_2S_5 .]

[Antimonites, as $KSbO_2$, give white pr. with HCl soluble in excess. $HCl + H_2S$, orange Sb_2S_3 , soluble in HCl as $SbCl_3$. Thus: $Sb_2S_3 + 6HCl = 2SbCl_3 + 3H_2S$.]

[Antimonates. $K_2H_2Sb_2O_7$ with HCl , white $H_4Sb_2O_7$. With sodium salts $K_2H_2Sb_2O_7$ gives white $Na_2H_2Sb_2O_7$, the only insoluble sodium salt. $HCl + H_2S$ orange Sb_2S_5 .]

XIX. Urates. Only alkaline urates soluble. Colorless.

Blue restored to red litmus. **HCl**, white crystalline uric acid $C_5H_4N_4O_3$, insoluble in water, sol. in boiling H_2SO_4 . **HNO₃** in drops, evaporated to dryness in porcelain basin, gives yellow-red residue, turned purple by NH_3 (maurexid). On platinum, carbonizes without flame, and leaves no residue: CNH among the products. Urates leave carbonates when ignited. Ammonium urate evolves NH_3 when heated with Na_2CO_3 . Lithium urate, the most soluble. Acid urates, least.

XX. Hippurates. Colorless. Alkaline. **HCl**, white needles of hippuric acid, requiring 600 parts of cold water for solution, but easily soluble in boiling water. **CaCl₂** in hippurates no precipitate, as calcium salt is soluble. **AgNO₃**, white, soluble in NH_3 . **Fe₂Cl₆** cream-colored pr. Hippuric acid $CH_2.NH.C_7H_5O.COOH$, leaves a coaly residue, completely consumed in oxydizing flame; evolves CNH among other products. Boiled with acids, assimilates H_2O , and changed into glycocine $CH_2.NH_2.COOH$, and benzoic acid C_6H_5COOH . Heated with **KOH** gives off benzene C_6H_6 and NH_3 .

XXI. Gallates. Colorless; alkaline to test-paper. **HCl** minute white crystals, readily soluble in excess of acid. **Fe₂Cl₆** black, disappearing by heat. **AgNO₃** white; blackens by heat. Does not precipitate gelatin. Gallic acid $C_6H_2(OH)_3COOH$ soluble in 100 of cold, and 3 of boiling water. Acid reaction: decomposes Na_2CO_3 with effervescence. Magenta color with H_2SO_4 . Very soluble in ether. On platinum blackens instantly.

XXII. Tannates, alkaline soluble. Ba, Sr, and Ca tannates, sparingly soluble. **HCl** no visible reaction, as tannin $C_{14}H_{10}O_9$ very soluble in water. **Fe₂Cl₆** blue-black precipitate. **Pb₂C₇H₃O₂** white. Gelatin, white tannate. Turns dark brown with H_2SO_4 . On platinum fuses and blackens.

XXIII. Benzoates, all more or less soluble. **HCl** precipitates benzoic acid in scales, requiring 200 of cold and 25 of boiling water. **Fe₂Cl₆** bulky, flesh-colored, ferric benzoate, decomposed by **HCl** leaving scales of benzoic acid in the yellow **Fe₂Cl₆**. **AgNO₃**, white, sparingly soluble. Benzoic acid C_6H_5COOH melts at 120° ; its vapors are very acrid and irritating, and burn away with sooty flame. Is easily sublimed.

XXIV. Salicylates, more or less soluble. **HCl** precipitates salicylic acid in tiny white needles, soluble in excess. **Fe₂Cl₆** imparts a deep-violet to acid and salts, disappearing with **HCl**. Salicylic acid $C_6H_4(OH)COOH$ requires 1800 parts of cold water for solution; is readily soluble in alcohol and in oil of vitriol. Melts at 155° ; into CO_2 and phenol C_6H_5OH .

XXV. Tartrates. In sols. of $K_2C_4H_4O_6$ and of $(NH_4)_2C_4H_4O_6$, **HCl** precipitates white crystalline $KHC_4H_4O_6$ and $NH_4HC_4H_4O_6$ soluble in excess. See Group C.

B. Acids, the radicles of which are precipitated by barium chloride or barium nitrate, insoluble in hydrochloric or nitric acids. Includes sulphates, selenates and silicofluorides.

XXVI. Sulphates: all soluble except BaSO_4 , SrSO_4 and PbSO_4 ; $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ with difficulty. Neutral or acid to test-paper. BaCl_2 white BaSO_4 insoluble in HCl and in HNO_3 . CaCl_2 white $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, except in CaSO_4 or very weak solutions of other sulphates. $\text{Pb} \cdot \text{C}_2\text{H}_3\text{O}_2$, white PbSO_4 . Any insoluble sulphate on charcoal with Na_2CO_3 , fused, gives a sulphide causing a brown-black stain of Ag_2S , when moistened, on a clean silver coin. Free sulphuric acid $\text{SO}_2(\text{OH})_2$ or H_2SO_4 , oily liquid, volatile with white pungent fumes: heats with water. Effervesces with carbonates. Behaves like any other sulphate towards tests. On evaporation, even quite dilute, chars filter-paper when heated.

[Selenates, resemble sulphates. BaCl_2 , white BaSeO_4 insoluble in HCl ; boiled, evolves Cl_2 , and then H_2SO_3 separates red Selenium. The original solution, in blowpipe-flame, gives odor of horse-radish.]

XXVII. Silico-fluorides. SILICO-FLUORIC ACID $2\text{HF} \cdot \text{SiF}_4$, acid. $2\text{KF} \cdot \text{SiF}_4$ and $\text{BaF}_2 \cdot \text{SiF}_4$, with difficulty in water, insoluble in alcohol. The rest soluble. BaCl_2 , translucent BaF_2 , SiF_4 . KCl pr. $2\text{KF} \cdot \text{SiF}_4$. NH_4OH separates H_4SiO_4 . On Platinum, volatilizes: into $2\text{HF} + \text{SiF}_4$, therefore etches a glass vessel. Salts heated with H_2SO_4 , corrode glass.

C. Acids, the salts of which are precipitated by calcium chloride, soluble in nitric or hydrochloric acids. In addition to I. CARBONATES, III. SULPHITES, IX. FERROCYANIDES, XV. BORATES, XVIII. ARSENATES, XXVI. SULPHURIC ACID and SULPHATES, are the following:

XIII. Oxalates. Many insoluble, but soluble in HCl or in HNO_3 . HCl separates $\text{C}_2\text{O}_2(\text{OH})_2$ in solution: no visible reaction. BaCl_2 white BaC_2O_4 , sol. in HCl . CaCl_2 , white CaC_2O_4 , sol. in HCl , insoluble in acetic acid. AgNO_3 white $\text{Ag}_2\text{C}_2\text{O}_4$, sol. in HNO_3 and in NH_3 . Even CaSO_4 precipitates oxalic acid and oxalates, insoluble in CH_3COOH . On platinum, into carbonates, oxides or metal, without blackening. OXALIC ACID $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$, very soluble in water, very acid. Na_2CO_3 effervescence. Lime-water (and the other tests) an immediate white pr. of CaC_2O_4 , by heat into CaCO_3 without blackening. H_2SO_4 and heat into H_2O , CO_2 and CO , kindling with blue flame, and without darkening. On Platinum, fuses and decomposes without blackening; vapors white, coruscating, suffocating.

XXV. Tartrates. Neutral tartrates of alkalies readily soluble. $\text{KHC}_4\text{H}_4\text{O}_6$ and $\text{NH}_4\text{HC}_4\text{H}_4\text{O}_6$ with difficulty soluble. HCl from $\text{K}_2\text{C}_4\text{H}_4\text{O}_6$ and $(\text{NH}_4)_2\text{C}_4\text{H}_4\text{O}_6$, white crystalline

acid salts readily soluble. HCl white pr. in sols. of tartar emetic, sol. in excess and not precipitated by water: H_2S distinguishes Sb. BaCl_2 white. CaCl_2 white $\text{CaC}_4\text{H}_4\text{O}_6$, soluble, when washed, in KOH and in NH_4Cl ; and soluble in CH_3COOH . AgNO_3 white, sol. in HNO_3 and in NH_3 , reduced to silver by heat. Heated on platinum, they carbonize, with smell as of burnt sugar: leave carbonates, oxides or metal. Tartar emetic makes holes in Pt through alloy-formation. TARTARIC ACID $\text{H}_2\text{C}_4\text{H}_4\text{O}_6$, very acid. Na_2CO_3 effervescence. Lime-water precipitates it when added in quantity, sol. in acetic acid. H_2SO_4 heated with it, browns at once, with little evolution of CO . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white. On Platinum fuses, colors, carbonizes with flame and burnt-sugar smell, leaving no residue.

XXVIII. Citrates. Not precipitated by CH_3COOK . CaCl_2 an immediate prec. on heating, insoluble in KOH when washed, but sol. in NH_4Cl . Lime-water, in excess, on boiling, a slight white pr. disappearing on cooling. AgNO_3 white $\text{Ag}_3\text{C}_6\text{H}_5\text{O}_7$, sol. in NH_3 and HNO_3 , not blackening on heating. Citric acid $\text{H}_3\text{C}_6\text{H}_5\text{O}_7$, very soluble, and acid. Na_2CO_3 effervescence. CaCl_2 no prec. even after addition of NH_3 , until heated. H_2SO_4 , and heat, evolves at first CO in quantity, burning with blue flame, and only darkening at last. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white $\text{Pb}_3\text{C}_6\text{H}_5\text{O}_7$, sol. after washing, in NH_4OH . On Platinum, fuses, carbonizes, with evolution of pungent acid vapors, and burns away.

XXIX. Malates: not precipitated by CH_3COOK . CaCl_2 , on heating a white pr. in conc. solutions. Lime-water no reaction. AgNO_3 white $\text{Ag}_2\text{C}_4\text{H}_4\text{O}_5$, only gray on boiling. Malic acid $\text{H}_2\text{C}_4\text{H}_4\text{O}_5$, very acid, indistinctly crystalline, resembling glucose in appearance. Na_2CO_3 effervescence. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white, cryst. CaCl_2 no reaction. H_2SO_4 , heated gives CO and CO_2 , browning and blackening like Tartaric acid. On Platinum, fuses, pungent acid vapors with frothing effervescence; burns away.

XXX. Meconates. Colorless. CaCl_2 white. Fe_2Cl_6 , blood-red coloration, see Group D.

XXXI. Orthophosphates: of alkalis soluble. Chief salts:— $\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$, and $\text{NaNH}_4\text{HPO}_4 \cdot 4\text{H}_2\text{O}$. HCl no visible reaction. $\text{HCl} + \text{H}_2\text{S}$, none (not an arsenite). BaCl_2 white, sol. in HCl or HNO_3 . CaCl_2 white $\text{Ca}_3\text{P}_2\text{O}_4$ soluble in CH_3COOH . Fe_2Cl_6 , white FePO_4 . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white. $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH} + \text{MgSO}_4$, white, cryst. $\text{NH}_4\text{MgPO}_4 \cdot 6\text{H}_2\text{O}$. Ammonium molybdate in nitric acid yellow pr. containing 3 per cent. P_2O_5 . AgNO_3 , yellow Ag_3PO_4 , sol. in NH_4OH and in HNO_3 . On Platinum, fuse: into metaphosphates or pyrophosphates which give white AgPO_3 and $\text{Ag}_4\text{P}_2\text{O}_7$. ORTHOPHOSPHORIC ACID H_3PO_4 , sour, syrupy liquid, into clear glass HPO_3 on heating.

[Metaphosphates, by boiling with acids into orthophosphoric acid. In presence of acetic acid, HPO_3 precipitates albumen.

AgNO_3 , white gelatinous AgPO_3 . Not precipitated by magnesium-test.]

[Pyro-phosphates, by boiling with mineral acids into orthophosphoric acid. AgNO_3 , white $\text{Ag}_4\text{P}_2\text{O}_7$, soluble in NH_4OH and in HNO_3 .]

[Phosphites of alkaline metals soluble; others with difficulty. BaCl_2 , white. CaCl_2 , white, soluble in CH_3COOH . AgNO_3 , metallic silver. Hg_2NO_3 , metallic Hg. H_2SO_4 , changes $\text{P}(\text{OH})_3$ into H_3PO_4 , S being separated. PHOSPHOROUS ACID $\text{P}(\text{OH})_3$ by heat into $\text{PH}_3 + \text{H}_3\text{PO}_4$.]

XXXII. Fluorides. Alkaline soluble. BaCl_2 , white. CaCl_2 , gelatinous, white CaF_2 , nearly insoluble in HCl and in acetic acid. AgF is soluble. With H_2SO_4 and heat, pungent HF evolved which corrodes glass.

D. Acids, the presence of which is demonstrable by the Group-test Ferric chloride.

a. In presence of free HCl . FERROCYANIDES: blue precipitate.

b. In neutral solutions, or if acid on addition of sodium acetate, as the precipitate is occasioned even in presence of free acetic acid. Includes: ARSENATES, GALLATES and PHOSPHATES.

c. Only in neutral solutions. Includes: BORATES, BENZOATES, and SUCCINATES.

XV. Borates, see above.

XXIII. Benzoates, for the most part soluble. HCl white crystalline scales of BENZOIC ACID. Fe_2Cl_6 bulky, flesh-colored ferric benzoate, decomposed by HCl with separation of benzoic acid (p. 34).

XXXIII. Succinates. Mostly soluble. HCl no visible reaction, as succinic acid is readily soluble in water, alcohol and ether. Fe_2Cl_6 , pale cinnamon-colored ferric succinate, readily soluble in HCl . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$ white $\text{PbC}_4\text{H}_4\text{O}_4$, readily sol. in excess of test. BaCl_2 and NH_4OH no precipitate until alcohol added. AgNO_3 , white. SUCCINIC ACID $\text{C}_2\text{H}_4(\text{COOH})_2$ in colorless, inodorous prisms, readily soluble. Volatile: can be sublimed. On Platinum burns with sootless flame. Succinates by heat into carbonates (blackening) or oxides or metal.

d. Only coloration in presence of HCl . Includes: X. FERRICYANIDES and XI SULPHOCYANIDES (see above).

e. The red or black coloration disappears on addition of HCl . Includes: XII. ACETATES, FORMATES, XXII. TANNATES, XXXIII. MECONATES, and III. SULPHITES.

XII. Acetates, all more or less soluble. Calcium and ferric acetates very soluble: not precipitated by CaCl_2 or Fe_2Cl_6 . HCl separates CH_3COOH in solution. Fe_2Cl_6 dark-red coloration, yellow on addition of HCl . AgNO_3 crystalline, greasy-

looking precipitate, soluble in hot water. Hg_2NO_3 , similar pr., readily soluble in the test. H_2SO_4 evolves ACETIC ACID CH_3COOH , known by its pungent odor: mixed with alcohol and heated, agreeable-smelling ETHYL ACETATE $\text{CH}_3\text{COOC}_2\text{H}_5$ is formed. On **Platinum**, into carbonates, somewhat carbonaceous, oxides or metal. ACETIC ACID is pungent, acid, very volatile, liquid, leaving no residue. NH_4OH must be added to obtain proper reaction with Fe_2Cl_6 .

[Formates are all soluble. Fe_2Cl_6 , similar to acetates. H.COOAg and $(\text{H.COO})_2\text{Hg}_2$, readily reduced to metallic state by heat.]

XXII. Tannates, see above. Gelatin precipitates tannin.

XXXIII. Meconates: already mentioned. Alkaline meconates readily soluble. CaCl_2 white meconate: by HCl crystalline scales of MECONIC ACID $\text{H}_3\text{C}_7\text{HO}_{7,3}\text{H}_2\text{O}$. Fe_2Cl_6 blood-red coloration, not bleached by HgCl_2 , nor by AuCl_3 , but by HCl . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$ white (none with an acetate). AgNO_3 , white, sol. in NH_3 and in HNO_3 . On **Platinum**, meconic acid loses water, melts, inflames, leaving eoaly residue which burns away.

E. Acids, salts of which, or the radicles of which, are precipitated by silver nitrate.

a. *In neutral solutions only, and the precipitate is readily soluble in dilute nitric acid.* Includes: PYRO- and META-PHOSPHATES, BORATES, OXALATES, &c., white; ARSENITES, yellow and ORTHOPHOSPHATES, yellow; ARSENATES, liver-brown; CHROMATES, crimson, &c.

b. *The precipitate is insoluble in dilute nitric acid.* Besides SULPHIDES, black; FERRICYANIDES, red-brown; SULPHOCYANIDES, CYANIDES, FERROCYANIDES, IODATES, white, we include chlorides, bromides, iodides.

XXXIV. Chlorides: all soluble except AgCl and Hg_2Cl_2 ; with difficulty PbCl_2 and TiCl_4 . Generally colorless. Neutral or acid to test-paper. Many volatile. AgNO_3 , white, curd-like, fusible AgCl : soluble in NH_4OH , and to some extent in strong mineral acids, from which it is re-precipitated by water. Hg_2NO_3 , white Hg_2Cl_2 , by NH_3 into black $\text{Hg}_2\text{H}_2\text{NCl}$. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white PbCl_2 , except in dilute solutions. Heated with $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 , blood-red drops of CrO_2Cl_2 condense from brown-red vapor. HYDROGEN CHLORIDE HCl is acid, volatile, suffocating: with HNO_3 it deepens to yellow-red in color, and evolves $\text{Cl}_2 + \text{NOCl}_2$. Leaves no residue on **Platinum**. Fumes with glass-rod dipped into NH_3 . If a trace of a chloride be added to a bead of NaPO_3 containing a little CuO , and the bead heated in the reducing flame, blue flame will be observed. $\text{MnO}_2 + \text{H}_2\text{SO}_4$ added to a chloride yields Chlorine gas which

bleaches, and separates Br and I respectively from alkaline bromides and iodides.

XXXV. Bromides: very closely resemble chlorides. AgNO_3 , yellowish-white AgBr , sparingly soluble in NH_3 , and insoluble in dilute HNO_3 . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white PbBr_2 , less soluble than PbCl_2 . Hg_2NO_3 yellowish-white Hg_2Br_2 . Cl_2 water colors a soluble bromide yellow or yellow-red from Br_2 , which is soluble with orange-color in CHCl_3 ; starch is colored orange. HNO_3 separates Br_2 , with red-brown vapor condensing to blood-red drops. HYDROGEN BROMIDE HBr is acid, colorless, completely volatile without residue. Cl_2 sets Br_2 free. AgNO_3 yellowish-white AgBr , insoluble in dilute HNO_3 . HNO_3 separates Br_2 . AgCl decomposed by KBr into $\text{AgBr} + \text{KCl}$.

XXXVI. Iodides: many iodides insoluble. AgNO_3 , whitish-yellow AgI , insoluble in NH_4OH and in HNO_3 . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, yellow PbI_2 , sol. in much water. HgCl_2 scarlet HgI_2 . Hg_2NO_3 , finch-green Hg_2I_2 . Mixed $\text{CuSO}_4 + \text{FeSO}_4$, white Cu_2I_2 . Cl_2 water separates brown I_2 , soluble in CHCl_3 to amethystine color. HNO_3 containing HNO_2 precipitates blue-black iodine, the vapor of which is violet, and forms blue iodide with starch. $\text{MnO}_2 + \text{H}_2\text{SO}_4$ liberates I_2 . Bead of NaPO_3 saturated with CuO , heated on Platinum-wire with an iodide, imparts green color to reducing flame. HYDROGEN IODIDE HI , browns rapidly from separation of I_2 , acid, volatile without residue. Cl_2 separates I_2 . Free I_2 discoverable by shaking up with CHCl_3 .

Any insoluble chloride, bromide, or iodide fused with Na_2CO_3 , will contain respectively NaCl , NaBr , NaI in a soluble form. AgCl is decomposed by KI into $\text{AgI} + \text{KCl}$.

F. Acids, the salts of which are all soluble in water, and are therefore not precipitated by reagents. Includes: chlorates and nitrates, and [PERCHLORATES].

Chlorates (VI.) have been described at p. 30. HCl produces green-yellow euchlorine $\text{Cl}_2\text{O}_4 + 3\text{Cl}_2$, especially when heated. H_2SO_4 evolves Cl_2O_4 as greenish-yellow gas: sulphindigotic acid then decolorized. If a chloride present, Ag_2SO_4 can be added to remove Chlorine.

XXXVII. Nitrates: all soluble, except $\text{Bi}_2\text{O}_3, 2\text{HNO}_3$. HCl concentrated, evolves NOCl_2 and Cl_2 which dissolves gold-leaf. Dilute; no reaction. BaCl_2 no reaction. AgNO_3 no reaction. Add FeSO_4 in solution, and then H_2SO_4 more or less freely. A dark-brown coloration ($2\text{FeSO}_4, \text{NO}$), at the point of junction, increasing by shaking and then disappearing, solution colored from ferric salt. Sulphindigotic acid turned yellow by the acid set free from a nitrate. Copper-turnings, together with H_2SO_4 , yield orange vapors of NO_2 . On Platinum, an alkaline nitrate first into a nitrite, and this, dissolved, gives with acetic acid,

KI and starch, blue iodide of starch. **FREE NITRIC ACID** HNO_3 , is colorless and caustic in odor; when fuming, yellow from HNO_2 . Strongly acid, volatile; leaves no residue. **HCl** produces more or less of a yellow or orange color, with fumes of chloro-nitric gas NOCl_2 and of Cl_2 , dissolving Au as AuCl_3 , bleaching litmus and indigo-solution. Na_2CO_3 effervescence. **Stains wool yellow.** FeSO_4 browns: on heating, if dilute. Cu when heated gives $2\text{NO} + \text{O}_2 = 2\text{NO}_2$ as orange-red vapors. If dilute, neutralize with CaCO_3 , filter, evaporate to dryness and decompose with H_2SO_4 containing solution of ferrous sulphate.

[**Perchlorates.** **HCl** added, indigo-solution not bleached. Evolve O on heating, and changed into chlorides: **KCl** in concentrated sols. pr. KClO_4 .]

RECAPITULATION.

Salts of organic acids, except oxalates, acetates, and formates, are charred when heated. In presence of **HCl**, soluble carbonates, sulphides, hyposulphites, nitrites, ferrocyanides, benzoates, hippurates and urates, chlorates, hypochlorites, and silicates are at once recognizable. Even in admixture a carbonate is learnt by a careful addition of the test. If **HCl** produces no reaction, the addition of H_2S settles the presence or otherwise of **chromic acid** (p. 33) of As_2O_3 (p. 14): boiling, concentrating and further addition of H_2S would indicate by yellow $\text{As}_2\text{S}_3 + \text{S}_2$, presence of arsenic acid (p. 15). **Barium chloride** BaCl_2 precipitates, in addition to the above-named, iodates, bromates, borates, phosphates, oxalates, fluorides, sulphates, silicofluorides, and ferrocyanides; precipitated BaSO_4 , and BaF_2SiF_4 are insoluble in **HCl**. **Silver nitrate** precipitates chlorides, bromides, iodides, cyanides, and ferricyanides: chloride of barium does not precipitate them. **Ferric chloride** is also an admirable test. The **red-brown** coloration disappears in the case of acetates, meconates, formates, and the **black** coloration in the case of the gallates, on addition of **HCl**, but the **brown** coloration of ferricyanide and the **blood-red** sulphocyanide are not thus bleached. **HCl**, however, in no wise interferes with the **FERROCYANIDE** reaction. Only in neutral solutions a borate, benzoate and succinate can produce a ferric precipitate, and only in presence of acetic acid, a phosphate, arsenate and tannate.

For further particulars, see the respective acids, the characteristic features of which can be easily mastered by the intelligent student. Except for grouping, **Tables** are not to be recommended unless constructed by the student himself.

II. THE SUBSTANCE IS INSOLUBLE IN WATER (see p. 12). If the substance is insoluble in water, it is boiled with strong HCl . The following gases may be evolved: CO_2 from a carbonate; H_2S from a sulphide; SO_2 from a sulphite or hyposulphite; HCN from a cyanide; Cl_2 from a peroxide or chromate (turns green); I_2 (violet vapor) from an iodate; Br_2 (orange) from a bromate. Many silicates gelatinize; in such case, evaporate to dryness, ignite gently, and re-dissolve in HCl ; SiO_2 remains behind as a white, insoluble powder, while the bases pass into solution.

If the main part of the substance has dissolved, filter or decant, boil off any large excess of HCl , dilute with a little water, and proceed with the use of Group-tests as given at pp. 11 and 12. **N.B.** If crystals form in the solution on cooling, e.g. arsenious, boracic, benzoic, hippuric, uric, and gallic acids, lead chloride, barium chloride, calcium, barium, strontium and magnesium phosphates and oxalates,—more water should be added. A yellow residue may be sulphur or titanous acid: an orange one, with odor of CNH , a sulphocyanide. A turbidity, on dilution, indicates **Sb** or **Bi**. If the solution gives a precipitate with $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$, a phosphate or oxalate may be present, as well as Fe_2 , Al_2 or Cr_2 . In this case, test the original substance as follows: *a.* Heat on platinum foil, treat the ash with HCl ; effervescence indicates oxalate; test for the probable basyl **Ca**, **Ba**, **Sr**. *b.* To a solution of ammonium molybdate in HNO_3 , add a drop of the HCl solution, and warm,—a yellow precipitate indicates a phosphate. *c.* To a fresh portion of the HCl solution, add sodium acetate in excess: CrPO_4 is green, FePO_4 , and AlPO_4 are white and gelatinous. Test for **Fe** (p. 19); if absent, nearly neutralize another portion with Na_2CO_3 , boil with pure KOH and BaCO_3 and filter; to the filtrate add HCl in excess, then NH_4OH in excess, and warm,—white gelatinous aluminum hydroxide will be precipitated. The barium precipitate on the filter is dissolved in hot dilute HCl , H_2SO_4 added to remove **Ba** as BaSO_4 , the solution boiled, filtered, and tested with NH_4Cl , NH_4OH and MgSO_4 for the presence of a phosphate, which will be indicated by a white, crystalline deposit of $\text{NH}_4\text{MgPO}_4 \cdot 6\text{H}_2\text{O}$. *d.* If sodium acetate has produced a precipitate, filter and add to the filtrate NH_4OH : a precipitate indicates excess of $\text{Al}_2(\text{OH})_6$, $\text{Fe}_2(\text{OH})_6$ or $\text{Cr}_2(\text{OH})_6$. *e.* If no reaction with sodium acetate, add Fe_2Cl_6 till solution reddish,—a white precipitate indicates calcium, barium, strontium or magnesium phosphate; boil till liquid colorless, filter, test the filtrate for these metals (pp. 24, 25). If necessary, the ferric precipitate can be tested for orthophosphoric acid, by dissolving in warm HCl , adding tartaric acid to prevent the separation of ferric, NH_4OH and then MgSO_4 to the clear solution: crystalline $\text{NH}_4\text{MgPO}_4 \cdot 6\text{H}_2\text{O}$ follows, if phosphate present. *f.* Fluorides and borates of **Ba**, **Sr**,

Ca and **Mg** may also be preecipitated by NH_4OH ; therefore the original substance must be tested on **Platinum** with H_2SO_4 ,—a **BORATE** gives **green** color to flame. **Fluorides** evolve **HF**, which corrodes glass. If either present, add more NH_4Cl and test for **Ba**, **Sr**, **Ca** or **Mg**.

If insoluble in **HCl**, boil with HNO_3 . Remove nearly all the free acid by evaporation, and test the solution for the various bases under the different Groups.

If insoluble in HNO_3 , boil with aqua regia. Remove free acids, dilute and test. Be careful to remove both HNO_3 and Cl_2 , as they decompose H_2S , with deposition of Sulphur.

As regards the examination for the radicle in substances only soluble in acids, indications have already been noted (p. 40). All borates are soluble in **HCl**; on **Platinum** with H_2SO_4 , all borates give **green** color to flame. In the **HCl** solution, BaCl_2 discovers a sulphate (p. 35); in any sulphide, the action of nitric acid would be to create a sulphate. In the case of silicates, evaporate to dryness, ignite and re-dissolve in **HCl**: silica SiO_2 , remains undissolved. Phosphates are all decomposed by acids; their detection has been explained at pp. 36, 41. In the case of an organic salt, blackening with a residue would occur; dissolve the residue in HNO_3 , evaporate, re-dissolve in water, precipitate by H_2S or by Na_2CO_3 , and in the filtrate test for the base.

IF A SUBSTANCE IS INSOLUBLE IN WATER AS WELL AS IN ACIDS, various methods must be employed. Carbon disappears when strongly ignited, and deflagrates with KNO_3 . **AgCl**, **AgBr** and **AgI** melt when heated, and give metallic **Ag**, heated with Na_2CO_3 . Al_2O_3 , is white, infusible, is turned blue, when ignited with Co_2NO_3 : unloeked by fusion with KHSO_4 . SnO_2 and Sb_2O_3 give ductile or brittle metallic beads respectively of **Sn** or **Sb** when heated on charcoal with Na_2CO_3 . In a platinum eapsule they may be reduced by $\text{Zn} + \text{HCl}$; **Sb** will stain the **Pt** black. They may also be unloeked by fusion with Na_2CO_3 . Silica and certain silicates are untouched by acids; heated in the sodium metaphosphate bead they yield a skeleton of SiO_2 . They can be unloeked by **HF**; or by fusion with $\text{Ba}(\text{OH})_2$; or with 3 times their weight of Na_2CO_3 , treatment with **HCl**, evaporation to dryness, moistening with **HCl**, and addition of water which leaves SiO_2 undissolved. If **K** or **Na** to be sought for, then $\text{Ba}(\text{OH})_2$ must be used. Fluorides are white: all evolve **HF** when heated with H_2SO_4 , and corrode a watch-glass placed over the platinum-eapsule. Chromic oxide gives a **green** bead with borax. It is best unloeked with a mixture of Na_2CO_3 and KNO_3 , yielding soluble yellow chromate. Some alloys are best heated

in an atmosphere of chlorine, after admixture with sodium chloride.

LIST OF SUBSTANCES, ONE OR OTHER OF WHICH IS GIVEN FOR ANALYSIS AT THE FIRST M.B. EXAMINATION OF THE UNIVERSITY OF LONDON.

A. Alcohol, urea, sucrose, dextrose, starch and glycerin.
B. The alkaloids morphin, strychnin, quinin and cinchonin.
C. Oxalic, tartaric, citric, malic and uric acids. D. Succinic, benzoic and hippuric acids. E. Acetic acid. F. Meconic, tannic and gallic acids. G. Sulphocyanides, ferrocyanides and ferricyanides. H. Cyanides.

General remarks. Alcohol, urea, sucrose, dextrose, starch and glycerin are neutral or only very faintly acid to test-paper.

All the **free acids**, viz. oxalic, tartaric, citric, malic, succinic, benzoic, hippuric, acetic, meconic, tannic and gallic acids, occasion effervescence with **sodium carbonate**, which last is recommended to be used after application of test-paper. If there is no effervescence, the above-mentioned acids may be passed over. If there is no precipitate, either immediate or after continuous stirring, the absence of most bases (including the alkaloids morphin, strychnin, quinin and cinchonin) may be inferred, excepting ferric, potassium, sodium and ammonium (L, Cs and Rb). The only acids leaving no solid residue are **acetic** and **hydrocyanic acids**, but the former occasions effervescence with Na_2CO_3 : both are surely recognizable by the smell, and, the latter, by **silver nitrate**, which precipitates silver cyanide. Uric acid is so nearly insoluble in water, that, except solid, or in the form of a strongly alkaline solution of urate of potassium, sodium or ammonium, it need not be thought of.

An alkaline solution should be tested with Na_2CO_3 : basic lead acetate would be precipitated, and any other metallic salt, the carbonate of which is insoluble in water. Heat should always be applied to make sure of the absence of a salt of ammonium. On application of gentle heat, a solution of tartar emetic is precipitated. A solution of a urate, or of potassium cyanide, would be strongly alkaline and unaffected by Na_2CO_3 ; so also would be an alkaline hippurate, gallate, tannate and possibly other organic salts. **Hydrochloric acid**, *carefully added*, is the next most important test, as it not only precipitates PbCl_2 from $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, and basic antimonous chloride from tartar emetic, readily soluble in excess, but it precipitates URIC ACID (as a powder), HIPPURIC ACID (in needles), BENZOIC ACID (in scales), GALLIC ACID (easily soluble), FERROCYANIC ACID (bluish white) from a **yellow** solution, and potassium hydrogen tartrate from neutral TARTRATE, as a white crystalline powder (readily soluble).

Hydrogen sulphide may be added to any precipitate with HCl , and any doubt as to the metallic character or otherwise confirmed. **Ferric chloride** gives most important reactions. With **GALLIC** and **TANNIC ACIDS** a blue-black coloration or precipitate, bleached by HCl : gelatin precipitates tannin alone. With neutral salt of **MORPHIN**, a dark blue color: orange with HNO_3 . With **SULPHOCYANIDES**, intense blood-red color, not bleached by HCl , but by HgCl_2 . With **ACETATES**, deep red-brown color, bleached by HCl : the original salt with alcohol and sulphuric acid yields ethyl acetate. With **MECONATES**, an intense port-wine color, not bleached by HgCl_2 or by AuCl_3 , but by HCl . With **FERROCYANIDES**, **Prussian blue**, not altered by HCl . With **FERRICYANIDES**, brown color, not bleached by HCl (with a ferrous salt, **Turnbull's blue**). With benzoic, hippuric and succinic acids no reaction, but with **BENZOATES**, **HIPPURATES** and **SUCCINATES**, respectively, a flesh-colored, a brown, and a red-brown precipitate: on addition of **HCl**, scales of benzoic acid, needles of hippuric acid and no separation of succinic acid. No precipitation with **OXALATES**, **TARTRATES**, **CITRATES** and **MALATES**, and no change of color, beyond what springs from dilution of the ferric chloride. **Calcium chloride** is also a Group-test. Succinate, benzoate, hippurate, and acetate of calcium, are sufficiently soluble in water to allow of the detection of the radicles with ease: in soluble salts of these radicles, of course CaCl_2 will produce no visible results. **Oxalate of calcium** is so insoluble, that even lime-water produces an immediate precipitate in soluble oxalates, insoluble in acetic acid. **Tartrate of calcium** is so little soluble in water, that lime-water in excess precipitates tartaric acid, but the precipitate is soluble in acetic acid. Of course CaCl_2 , precipitates both an oxalate and a tartrate. Lime-water, in excess, has no effect upon **CITRIC ACID**, until boiled, when **calcium citrate** is precipitated. Under no circumstances, however, could lime-water precipitate a soluble malate or malic acid. For the distinctive tests see pp. 48, 49.

In addition to the tests here enumerated, the effects of heat are to be particularly studied. Thus, the **ALKALOIDS** fuse, and burn like resins, with a beautiful, sooty flame. They are practically insoluble in water, although their solution blues red litmus paper. As salts, morphin, strychnin, quinin and cinchonin are precipitated by sodium carbonate. **Nitric acid** in excess will distinguish morphin: sulphuric acid added to the solid alkaloid or salt, together with MnO_2 , or PbO_2 , or $\text{K}_2\text{Cr}_2\text{O}_7$, will, by the purple color, decide for strychnin: chlorine water and ammonia, by the green color, settle the presence of quinin. Solutions of salts of cinchonin are not fluorescent, are not turned green by $\text{Cl}_2 + \text{NH}_4\text{OH}$, and the precipitate effected by NH_4OH is not soluble in ether, as is quinin when similarly treated.

The use of **argentum nitrate** has been already commended at pp. 1, 10. **Silver oxalate** is white and soluble in dilute nitric acid; **silver cyanide**, **ferrocyanide** and **sulphocyanide** are also white, but insoluble in dilute nitric acid. **Silver ferricyanide** is red-brown and insoluble in dilute nitric acid. The distinctive tests for the various substances are as follows:—

GROUP A includes **ALCOHOL**, **UREA**, **SUCROSE**, **GLUCOSE**, **STARCH**, and **GLYCERIN**.

Alcohol ethylic $\text{CH}_3\text{CH}_2\text{OH}$. Colorless liquid of purely spirituous odor, neutral to test-paper, leaving no residue on platinum. Unless very weak, it is inflammable, burning with pale-blue flame. $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$, reduced to blue-green or green salt of chromic oxide. Heated with H_2SO_4 and CH_3COOH , alcohol yields $\text{CH}_3\text{COOC}_2\text{H}_5$.

Urea $\text{CO}(\text{NH}_2)_2$, in solution, is colorless and inodorous. Neutral to test-paper. Carefully evaporated, a solid crystalline residue is left, easily fusible, emitting ammoniacal odors, discoverable by red litmus paper: it solidifies soon after fusion, as white cyanuric acid $\text{C}_3(\text{OH})_3$, which entirely volatilizes without blackening. Na_2CO_3 no precipitation, as urea is so very soluble. HNO_3 in large excess, white crystalline $\text{CO}(\text{NH}_2)_2$, HNO_3 , readily soluble in water. $\text{C}_2\text{O}_2(\text{OH})_2$, behaves similarly.

Urea in colorless, four-sided prisms, very sol. in water and in alcohol. Neutral. Fuses to clear liquid: evolves NH_3 and CNONH_2 , solidifies and volatilizes as CNOH without blackening. Na_2CO_3 no reaction on its solution in water. HNO_3 precipitates white $\text{CO}(\text{NH}_2)_2 \cdot \text{HNO}_3$. Instantly decomposed by 2HNO_2 into: $\text{CO}_2 + 2\text{N}_2 + 3\text{H}_2\text{O}$. Salts of urea are acid; effervesce with Na_2CO_3 , but afford no precipitate.

Sucrose $\text{C}_{12}\text{H}_{22}\text{O}_{11}$, in solution, is colorless and inodorous. Neutral to test-paper. On evaporation becomes syrupy, then yellow, deepens in color, intumescs, inflames, evolves smell of burnt sugar as it blackens, gives coaly residue which burns away. Na_2CO_3 no react. on. $\text{CuSO}_4 + \text{KOH}$, the latter till deep-blue solution, no precipitate if heated till near boiling. H_2SO_4 in excess, gives mass of carbon. KOH no distinctive reaction.

Sucrose $\text{C}_{12}\text{H}_{22}\text{O}_{11}$, in colorless, transparent, four-sided, oblique-rhombic prisms, very soluble in water, forming a thick syrup. Melts to glassy mass. Heated to 160° into **GLUCOSE** $\text{C}_6\text{H}_{12}\text{O}_6$, and **LAEVULOSAN** $\text{C}_6\text{H}_{10}\text{O}_5$; at 210° into caramel $\text{C}_{12}\text{H}_{18}\text{O}_9$; then, with evolution of inflammable gases into carbonaceous mass which burns away. H_2SO_4 into carbonaceous matter. Does not at once reduce cupric hydrate, when blue solution of cupric hydrate with sucrose in KOH is boiled: but, when solution of sucrose is heated with dilute acids, it is changed into dextrose, p. 46.

Glucose $C_6H_{12}O_6$, in solution, is colorless, or yellow-tinted; neutral or faintly acid. Na_2CO_3 no reaction. On Platinum behaves like sucrose. $CuSO_4$ and KOH in excess, a deep-blue solution from which yellow cuprous hydroxide, and then red cuprous oxide is precipitated, even before liquid boils. KOH on heating, a rich mahogany color. H_2SO_4 converts glucose into SULPHO-SACCHARIC ACID $C_6H_{12}O_5SO_3$.

DEXTROROSE OR GLUCOSE $C_6H_{12}O_6$, H_2O , dissolves in 1.23 parts of water, and is less sweet than sucrose. It is soluble in alcohol. At 170° into glucosan $C_6H_{10}O_5$. It dissolves BaO , CaO and PbO , and combines also with $NaCl$.

Starch $C_{18}H_{30}O_{15}$ affords a more or less gelatinous liquid, neutral or faintly acid. Or only opalescent. Evaporated on Platinum, a whitish or yellowish residue, burning with yellow flame, leaving first a carbonaceous residue which completely oxydizes. Na_2CO_3 , no reaction. Iodine water, strikes a deep-blue color, disappearing on heating: the chief test. Dilute sulphuric changes it into glucose. H_2SO_4 into AMIDIN-SULPHURIC ACID.

STARCH $C_{18}H_{30}O_{15}$, a soft, white, glistening powder, insoluble in cold water. Forms a thick, unmistakable paste when boiled with water, and is at once recognized by solution of iodine.

Glycerin $C_3H_5(OH)_3$, in solution, is more or less viscid. Neutral, or faintly acid. Na_2CO_3 no reaction. On evaporation, more and more viscid, evolving in a test-tube white vapors smelling of red-hot candle-wick. Heated then with $KHSO_4$, acrolein of pungent, irritating odor. On Platinum, it burns with steady white flame without blackening and without residue, remaining liquid until the end.

GLYCERIN $C_3H_5(OH)_3$, colorless, viscid liquid, of sp. gr. 1.27, boiling at $200^\circ C$. Intensely sweet. Readily soluble in water and in alcohol. By loss of $2H_2O$, into ACROLEIN C_3H_4O , most pungent of vapors.

GROUP B. Includes MORPHIN, STRYCHNIN, QUININ and CINCHONIN.

Heated on Platinum they fuse, redden, and burn with bright sooty flame, leaving sooty incrustation which burns away. Very little soluble in water: solutions blue red litmus. Na_2CO_3 , with brisk stirring separates the respective alkaloids, more or less rapidly, from solutions of their salts.

Morphin $C_{17}H_{19}NO_3$, only soluble in 1000 of water. Solution of salts neutral or acid. Na_2CO_3 , on stirring, white, crystalline precipitate. Fe_2Cl_6 , dark blue. HNO_3 gives deep-orange color,

oven in solutions of salts. Mixed with HIO_3 , iodine is liberated, blues starch, and dissolves with amethystine color in CHCl_3 . Mixed $\text{HNO}_3 + \text{H}_2\text{SO}_4$, a green coloration.

MORPHIN $\text{C}_{17}\text{H}_{19}\text{NO}_3 \cdot \text{H}_2\text{O}$, in short, rectangular prisms, sol. in 400 boiling water. Soluble in alcohol, but not in ether and chloroform. Soluble in KOH. Turmeric browned. HNO_3 , deep-orange. Salts very soluble in water and alcohol: morphin precipitated by Na_2CO_3 , and by NH_4OH ; stirring generally required.

STRYCHNIN $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2$, almost insoluble in water (7000 parts). Solution of salts, neutral, soluble. Na_2CO_3 , white, crystalline precipitate. KOH, likewise; needles as seen under microscope. NH_4OH , white, soluble in excess. The dry salt, or alkaloid, with H_2SO_4 in porcelain dish and $\text{K}_2\text{Cr}_2\text{O}_7$, blue-violet color, changing to red and reddish-red. With MnO_2 or with PbO_2 , a similar reaction. Chlorine water a white precipitate.

STRYCHNIN $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2$, in brilliant rhombic prisms, insoluble in absolute alcohol, ether, and KOH; readily soluble in CHCl_3 . Its salts, if acid, are not precipitated by NaHCO_3 . KCNS in solutions, white crystalline tufts.

Quinin $\text{C}_{20}\text{H}_{22}\text{N}_2\text{O}_2$, soluble in 350 parts of water. Its salts may be neutral or acid, and reflect a bluish tint. NaHCO_3 easily precipitates quinin. KOH and NH_4OH , white, amorphous, readily soluble in ether. Chlorine water and then NH_4OH , an emerald-green color. $\text{Cl} + \text{K}_4\text{FeCy}_6 + \text{NH}_4\text{OH}$, deep-red tint, changing to dirty-brown.

QUININ $\text{C}_{20}\text{H}_{22}\text{N}_2\text{O}_2$, in silky needles, soluble in alcohol and ether. H_2SO_4 dissolves it with slight yellow color. HNO_3 , colorless. Salts fluorescent. Turns plane of polarization to the left.

Cinchonin $\text{C}_{20}\text{H}_{24}\text{N}_2\text{O}$, is less soluble in water. Salts more soluble in water, and in alcohol, than those of quinin. NaHCO_3 white, amorphous. KOH and NH_4OH , white, amorphous cinchonin, insoluble in ether. Chlorine water and then NH_4OH , a yellowish-white precipitate. K_4Cfy white flocculent ferrocyanide, soluble in excess, and, after gentle heat, separating in golden scales or needles.

CINCHONIN $\text{C}_{20}\text{H}_{24}\text{N}_2\text{O}$, in large, quadrilateral prisms, less soluble in alcohol than quinin and insoluble in ether. Readily sublimed in hydrogen. Turns plane of polarization to the right. CINCHONIDIN is laevo-gyrate.

GROUP C. Includes OXALIC, TARTARIC, CITRIC and MALIC ACIDS.

Heated on Platinum they fuse. Oxalic acid decomposes, without carbonizing, and the fumes are white and very irritating. Tartaric acid carbonizes, and emits smell of burnt sugar. Citric acid also carbonizes, but the fumes are pungent. Malic

acid froths much, and also gives off pungent vapors. They are very soluble in water; neither the acids nor the salts are precipitated by ferric chloride. The calcium salts are either insoluble or with difficulty soluble in water.

Oxalic acid $C_2O_2(OH)_2 \cdot 2H_2O$. Page 35. Colorless rhombic prisms, soluble in eight parts of water. Strongly reddens litmus. Effervesces with Na_2CO_3 . **FERRIC CHLORIDE** NO REACTION. **Lime-water** an immediate white precipitate of CaC_2O_4 , insoluble in acetic acid. $CaCl_2$ and $CaSO_4$, white CaC_2O_4 , even in acetic acid solution. H_2SO_4 , on heating, decomposes it without darkening into CO and CO_2 , carbonic oxide burning with blue flame. **AgNO₃**, white, oxalate. **Pb₂C₂H₃O₂**, white, lead oxalate. **On Platinum**, fuses, and decomposes without carbonizing: fumes white, irritating and cough-provoking. **OXALATES** into carbonates, or oxides, or metal. Calcium oxalate is "mulberry calculus." By heat into $CaCO_3$, soluble with effervescence in HCl, not precipitated by NH_4OH , nor by $CaSO_4$, but by $C_2O_2(OH)_2$. See p. 24.

Tartaric acid $C_2H_2(OH)_2(COOH)_2 = C_4H_6O_6$. Page 35. Colorless oblique-rhombic prisms, very soluble. Acid reaction. Effervesces with Na_2CO_3 . **FERRIC CHLORIDE** NO REACTION. **Lime-water in excess** a white precipitate, soluble in acetic acid. $CaSO_4$ no precipitate (distinction between oxalic and tartaric acid). $CaCl_2$ no precipitate: but, in tartrates, soluble in ammonium chloride. **KOH**, white, crystalline, cream of tartar, if solution acid to test-paper. **NH₄OH**, white crystalline ammonium hydrogen tartrate, in acid solution. Test-paper should be inserted in the liquid, and the latter stirred or shaken. H_2SO_4 , browning and blackening at once, with evolution of gas. **Pb₂C₂H₃O₂**, white lead tartrate, very soluble in ammonia. **AgNO₃**, no precipitate: but one in tartrates. **On Platinum**, fuses, carbonizes, emits smell of burnt sugar, and residue burns away. Tartrates carbonize, evolve smell of burnt sugar. $K_2C_4H_4O_6$ very soluble in water, alkaline. $KHC_4H_4O_6$ acid to test-paper, requiring 160 parts of cold water. By heat into K_2CO_3 , with violet color to flame, sol. in HCl with effervescence, not prec. by NH_4OH , nor by Na_2CO_3 : with $PtCl_4$ yellow $2KCl, PtCl_4$. **TARTAR EME⁷IC** $2(KSbOC_4H_4O_6)H_2O$, is slightly acid, soluble, precipitated by HCl, and by Na_2CO_3 when heated. $HCl + H_2S$ orange Sb_2S_3 , sol. in HCl and also in $(NH_4)_2S_2$. **On Platinum**, violet color to flame, and the reduced antimony forms a fusible alloy with the platinum.

Citric acid $C_3H_4(OH)(COOH)_3 = C_6H_8O_7$. Page 36. Colorless, oblique-rhombic prisms, very soluble. Acid reaction. Effervescence with Na_2CO_3 . **FERRIC CHLORIDE** NO REACTION. **Lime-water**, in excess, no precipitate; but after boiling some time. $CaSO_4$ no precipitate. $CaCl_2$ no precipitate: but on

neutralizing with KOH. Neutralized with NH_4OH , no prec. with CaCl_2 until heated. H_2SO_4 readily evolves CO, with but slight change of color. This its behaviour, most like oxalic acid: only on long boiling darkens. AgNO_3 no reaction except in citrates: then white pr. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white, amorphous, freely soluble in ammonia. On platinum fuses, carbonizes; fumes pungent. CITRATES, with carbonization, into carbonates, or oxides, or metal.

Malic acid $\text{C}_2\text{H}_3(\text{OH})(\text{COOH})_2 = \text{C}_4\text{H}_6\text{O}_5$. Page 36. Deliquescent, indistinctly crystalline. Very acid. Effervesces with Na_2CO_3 . FERRIC CHLORIDE NO REACTION. Lime-water no reaction. CaSO_4 no reaction. CaCl_2 none, even after saturation with KOH or NH_4OH , but upon boiling. H_2SO_4 gases CO and CO_2 evolved, with almost immediate browning and blackening (resembles tartaric acid). AgNO_3 no reaction except in malates. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white malate, somewhat soluble in malic acid, sparingly in ammonia. Heated carefully in a test-tube, by heat into volatile maleic and fumaric acids. On platinum fuses, and evolves pungent, acid vapors.

N.B.—In presence of only one of these four acids, lime-water serves to distinguish.

Uric acid $\text{C}_5\text{H}_4\text{N}_4\text{O}_3$. Page 33. White powder, insoluble in water. Blackens immediately when heated, with odor of burnt hair. Solution of potassium urate strongly alkaline. HCl white precipitate of uric acid. HNO_3 as a drop, added to a mere trace of uric acid, and evaporated, a red-brown residue, turned purple by ammonia (purpurate of ammonium or murexid). CaCl_2 white calcium urate.

GROUP D. Includes SUCCINIC, BENZOIC, and HIPPURIC ACIDS. When heated they volatilize: hippuric acid with decomposition. The fumes of benzoic acid are most irritating. The calcium salts are soluble in water. Ferric chloride precipitates SUCCINATES, BENZOATES and HIPPURATES, respectively brownish-red, flesh-colored, and brown.

Succinic acid $\text{C}_2\text{H}_4(\text{COOH})_2 = \text{C}_4\text{H}_6\text{O}_4$. Page 37. Colorless, rhombic prisms, very soluble in water and alcohol, volatile when heated, leaving little carbon which burns away. Acid to test-paper. Effervesces with Na_2CO_3 . Ferric chloride no reaction: but in SUCCINATES a brownish-red pr. of ferric succinate, soluble in HCl with yellow color. CaCl_2 no reaction: in succinates none till alcohol is added. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white. BaCl_2 no reaction: but on addition of ammonia and alcohol, a white pr., and none with a benzoate. On platinum, burns with blue, sootless flame. SUCCINATES are decomposed by heat into carbonates and carbon, oxides and carbon, or metal.

Benzoic acid $C_6H_5\cdot COOH = C_7H_6O_2$. Pages 34 and 37. Colorless scales, soluble in 200 of cold and 25 of boiling water. Acid to test-paper. Effervescence with Na_2CO_3 . **Ferric chloride** no reaction; but in benzoates a flesh-colored prec. in which the ferric is dissolved by HCl , leaving white scales of benzoic acid. HCl separates benzoic acid, in scales, from soluble benzoates. $CaCl_2$ no reaction. $Pb_2C_2H_3O_2$ no reaction, but in benzoates. $BaCl_2$ no reaction. On platinum burns with bright sooty flame, with scarcely a residue. Fuses at 120° and sublimes at 145° . Vapors acrid and irritating. Crystals often odorous of gum-benzoin.

Hippuric acid $CH_2NH(C_7H_5O)COOH = C_9H_9NO_3$. Page 34. In rhombic prisms, soluble in 600 parts of cold, and readily in boiling water. Acid reaction. Effervescence with Na_2CO_3 . Salts alkaline. HCl , a precipitate of hippuric acid, increased by excess. Fe_2Cl_6 , brown precipitate; with HCl a yellow chloride, leaving prismatic crystals of hippuric acid. $Pb_2C_2H_3O_2$, curdy pr. $AgNO_3$ white pr. $Hg_2^2NO_3$ white. On platinum, melts, burns, leaving coaly residue which burns away.

GROUP E. Includes ACETIC, FORMIC, PROPIONIC, LACTIC, and BUTYRIC ACIDS. Only ACETIC ACID required. Volatile, and capable of distillation: calcium salt very soluble in water. On addition of ferric chloride a pale red color, turning yellow when HCl added.

Acetic acid $CH_3COOH = C_2H_4O_2$. Page 37. In scales, at low temperatures. Pungent, penetrating liquid, odorous of "vinegar." Acid to test-paper. Volatile without residue. Effervescence with Na_2CO_3 . **Ferric chloride**, pale-red color: in ACETATES deep red, yellow by HCl (compare sulphocyanide). $AgNO_3$, in acetates, white, nacreous crystals. $Hg_2^2NO_3$ in acetates, white, nacreous crystals. H_2SO_4 separates $CH_3\cdot COOH$ from acetates: with alcohol and H_2SO_4 , ACETIC ETHER formed. On platinum, acetates into carbonates, oxides, or metal.

GROUP F. Includes MECONIC, TANNIC, and GALLIC ACIDS. **Ferric chloride** produces a blood-red, a blue-black or a black color as well in the free acids as the salts, and the color disappears on addition of HCl . They are easily distinguished by tests.

Meconic acid $C_4HO(COOH)_3 = C_7H_4O_7$, page 38. In scales, sparingly soluble. Acid reaction. Effervescence with Na_2CO_3 . Fe_2Cl_6 blood-red color, not bleached by $HgCl_2$ or by $AuCl_3$, but by HCl . No coloration in presence of free HCl . $CaCl_2$ no reaction, but, in soluble meconates, white pr. of calcium meconate. $Pb_2C_2H_3O_9$ white precipitate.

Tannic acid $C_{14}H_{10}O_9$. Page 34. Yellowish powder, very soluble in water. Reddens litmus. Effervescence with Na_2CO_3 .

Sparingly soluble in ether. Fe_2Cl_6 blue-black precipitate, bleached by HCl . Solution precipitates gelatin. On platinum fuses, blackens and burns away.

Gallie acid $\text{C}_6\text{H}_2(\text{OH})_3\text{COOH} = \text{C}_7\text{H}_6\text{O}_5$. Page 34. Deliccate, silky needles requiring 100 parts of cold and 3 of boiling water, so that in solid state cannot be mistaken for tannic acid. Reddens litmus. Effervescence with Na_2CO_3 . In alkaline gallates, HCl carefully added, will precipitate gallie acid. Soluble in ether. Fe_2Cl_6 black color, bleached by HCl . Solution does not precipitate gelatin. $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white precipitate.

GROUP G. Includes **SULPHOCYANIDES**, **FERROCYANIDES**, and **FERRICYANIDES**. Only salts, probably of K , or NH_4 . Ferric chloride a deep blood-red color in sulphocyanides, a blue precipitate in ferrocyanides, and a brown coloration in ferricyanides, and the colors not removed by HCl .

Sulphocyanides. Page 32. KCSN and NH_4CSN , the chief salts. Colorless solution. Na_2CO_3 no reaction, except in NH_4CSN , when $(\text{NH}_4)_2\text{CO}_3$ evolved. Fe_2Cl_6 , deep blood-red color, not bleached by HCl : but, on addition of a small piece of zinc, bleached and H_2S evolved. Color also bleached by HgCl_2 . $\text{Pb}_2\text{C}_2\text{H}_3\text{O}_2$, white, very soluble in acetic acid and in the salt.

Ferrocyanides. Page 31. $\text{K}_4\text{FeCy}_{6,3}\text{H}_2\text{O}$ the chief salt. Lemon-yellow in color. Na_2CO_3 no reaction. Fe_2Cl_6 , Prussian-blue, even in presence of HCl . HCl , bluish-white pr. of H_4Cy , readily soluble in water. CuSO_4 , maroon Cu_2Cy .

Ferricyanides. Page 31. $\text{K}_6\text{Fe}_2\text{Cy}_{12}$, the chief salt. Brownish-green solution. Na_2CO_3 no reaction. Fe_2Cl_6 brown coloration not removed by HCl . HCl no visible reaction. FeSO_4 , Turnbull's blue.

GROUP H. Includes **CYANIDES**. Alkaline cyanides blue red litmus. CaCl_2 no reaction. Fe_2Cl_6 no reaction. AgNO_3 , white curd-like precipitate, soluble in strong HNO_3 and strong NH_4OH .

Cyanides. Page 31. CNK smells of prussic acid. A watch-glass dotted with silver nitrate, receives opalescent spots of CNAg . HCl more distinctly separates CNH . Na_2CO_3 no reaction. FeSO_4 , in cyanides, red precipitate. AgNO_3 , white CNAg , soluble in boiling HNO_3 , and in strong NH_4OH . $\text{FeSO}_4 + \text{KOH}$ heated, and HCl added, Prussian-blue remains. Boiled with a little $(\text{NH}_4)_2\text{S}_2$, evaporated, re-dissolved in much water and ferric chloride added, blood-red ferric sulphocyanide produced. Prussic acid, faintly acid, leaves no residue on Platinum; is readily distilled.

THE END.

LONDON:
PRINTED BY WILLIAM CLOWES AND SONS,
STAMFORD STREET AND CHARING CROSS.

Published by J. & A. Churchill,

Chemistry, Organic and Inorganic. With Experiments. By CHARLES L. BLOXAM, Professor of Chemistry in King's College, London; Professor of Chemistry in the Department for Artillery Studies, Woolwich. Third Edition. With 295 Engravings. Svo., 16s.

By the same Author.

Laboratory Teaching: or, Progressive Exercises in Practical Chemistry, with Analytical Tables. Fourth Edition. With 89 Engravings. Crown Svo., 5s. 6d.

How to Teach Chemistry: Hints to Science Teachers and Students. Six Lectures by EDWARD FRANKLAND, D.C.L., F.R.S. Summarised and Edited by GEORGE CHALONER, F.C.S. With 47 Engravings. Crown Svo., 3s. 6d.

Qualitative Analysis. By C. REMIGIUS FRESENIUS. Edited by ARTHUR VACHER. Ninth Edition. With Coloured Plate of Spectra and 47 Engravings. Svo., 12s. 6d.

By the same Author.

Quantitative Analysis. Edited by ARTHUR VACHER. Seventh Edition. Vol. I. With 106 Engravings. Svo., 15s.

Practical Chemistry and Qualitative INORGANIC ANALYSIS. By FRANK CLOWES, D. Sc. Lond., F.C.S. Lond. and Berlin. Second Edition. With 47 Engravings. Crown Svo., 7s. 6d.

Handbook of Chemical Technology. By RUDOLF WAGNER, Ph.D., Professor of Chemical Technology at the University of Wurtzburg. Translated and Edited from the Eighth German Edition, with extensive Additions, by WILLIAM CROOKES, F.R.S. With 336 Engravings. Svo., 25s.

New Burlington Street, London.

The Pocket Formulary and Synopsis of
the BRITISH and FOREIGN PHARMACOPŒIAS:
comprising Standard and approved Formulæ for the Pre-
parations and Compounds employed in Medical Practice.
By HENRY BEASLEY. Tenth Edition. 18mo., 6s. 6d.

By the same Author.

The Druggist's General Receipt-Book:
comprising a copious Veterinary Formulary, numerous
Reeipes in Patent and Proprietary Medicines, Druggists'
Nostrums, &c.; Perfumery and Cosmetics; Beverages,
Dietetic Articles and Condiments; Trade Chemicals;
Scientific Processes; and an Appendix of Useful Tables.
Eighth Edition. 18mo., 6s. 6d.

Also,

The Book of Prescriptions. Containing
3107 Prescriptions collected from the Practice of the most
eminent Physicians and Surgeons, English and Foreign.
With an Index of Diseases and Remedies. Fifth Edition.
18mo., 6s. 6d.

The Elements of Therapeutics. A Clinical
Guide to the Action of Drugs. By C. BINZ, M.D., Pro-
fessor of Pharmacology in the University of Bonn. Trans-
lated and Edited, with Additions, in conformity with the
British and American Pharmacopœias, by EDWARD I.
SPARKS, M.A., M.B. Oxon., formerly Radcliffe Travelling
Fellow. Crown 8vo., 8s. 6d.

A Dictionary of Materia Medica and
THERAPEUTICS. By ADOLPHE WAHLTUOH, M.D. 8vo.,
10s. 6d.

Pharmaceutical Guide to the First and
SECOND EXAMINATIONS. By JOHN BARKER SMITH.
Second Edition. Crown 8vo., 6s. 6d.

A Handy-Book of Forensic Medicine
and TOXICOLOGY. By W. BATHURST WOODMAN, M.D.,
F.R.C.P., and C. MEYMOTT TIDY, M.B., Professor of
Chemistry and of Medical Jurisprudence, &c., at the London
Hospital. With 8 Lithographic Plates and 116 Wood
Engravings. 8vo., 31s. 6d.

New Burlington Street, London.

Published by J. & A. Churchill,

An Atlas of Human Anatomy. Illustrating most of the ordinary Dissections, and many not usually practised by the Student. To be completed in 12 or 13 Bi-monthly Parts, each containing 4 Coloured Plates, with Explanatory Text. By RICKMAN J. GODLEE, M.S., F.R.C.S., Assistant Surgeon to University College Hospital, and Senior Demonstrator of Anatomy in University College. Imperial 4to., 7s. 6d. each Part.

Atlas of Topographical Anatomy, after Plane Sections of Frozen Bodies. By WILHELM BRAUNE, Professor of Anatomy in the University of Leipzig. Translated by EDWARD BELLAMY, F.R.C.S., Surgeon to, and Lecturer on Anatomy at, Charing Cross Hospital. With 34 Photo-lithographie Plates and 46 Woodcuts. Large Imperial 8vo., 40s.

Pathological Anatomy. Lectures by SAMUEL WILKS, M.D., F.R.S., Physician to, and Lecturer on Materia Medica at, Guy's Hospital. Second Edition. 8vo., with Plates, 18s.

By the same Author.

Lectures on Diseases of the Nervous SYSTEM. 8vo., 15s.

A Course of Operative Surgery. By CHRISTOPHER HEATH, F.R.C.S., Surgeon to University College Hospital, and Holme Professor of Surgery in University College. With 20 Plates drawn from Nature by M. LEVEILLÉ, and coloured by hand under his direction. Large 8vo., 40s.

Aural Surgery. A Practical Treatise. By H. MACNAUGHTON JONES, M.D., Surgeon to the Cork Ophthalmic and Aural Hospital. With 46 Engravings. Crown 8vo., 5s.

The Ear: its Anatomy, Physiology, and Diseases. A Practical Treatise. By CHARLES H. BURNETT, A.M., M.D., Aural Surgeon to the Presbyterian Hospital, and Surgeon in Charge of the Infirmary for Diseases of the Ear, Philadelphia. With 87 Engravings. 8vo., 18s.

New Burlington Street, London.

A Manual of Practical Hygiene. By EDMUND A. PARKES, M.D., F.R.S., late Professor of Hygiene to the Army Medical School, Netley. Fifth Edition by F. DE CHAUMONT, M.D., Professor of Military Hygiene in the Army Medical School. With 9 Plates and 112 Engravings. 8vo., 18s.

The Microscopist: a Manual of Microscopy and Compendium of the Microscopic Sciences, Micro-Mineralogy, Micro-Chemistry, Biology, Histology, and Pathological Histology. By J. H. WYTHE, A.M., M.D., Professor of Microscopy and Biology in the San Francisco Medical College. Third Edition. With 205 Illustrations. Royal 8vo., 18s.

A Toxicological Chart, exhibiting at one view the Symptoms, Treatment, and Mode of detecting the various Poisons, Mineral, Vegetable, and Animal. To which are added concise Directions for the Treatment of Suspended Animation. By WILLIAM STOWE, M.R.C.S.E. Thirteenth Edition. Sheet, 2s.; Roller, 5s.

The Poisonous Snakes of India. Compiled by JOSEPH EWART, M.D., M.R.C.P., Surgeon-Major in the Bengal Army, President of the Snake Poison Commission. With 21 Plates (19 being Coloured). Crown 4to., 31s. 6d.

A Manual of Photography. By GEORGE DAWSON, M.A., Ph.D., Lecturer on Photography in King's College, London. Eighth Edition. With Engravings. Fcp. 8vo., 5s. 6d.

Cooley's Cyclopædia of Practical RECEIPTS, and Collateral Information in the Arts, Manufactures, Professions, and Trades; including Pharmacy and Domestic Economy and Hygiene. Sixth Edition, revised and re-written by Professor RICHARD V. TISON, F.I.C., F.C.S., assisted by several Scientific Contributors. In about Fifteen Monthly Parts, at 2s. 6d. each

Surgical Emergencies, together with the Emergencies attendant on Parturition and the Treatment of Poisoning. A Manual for the Use of General Practitioners. By WILLIAM P. SWAIN, F.R.C.S., Surgeon to the Royal Albert Hospital, Devonport. Second Edition. Post 8vo., with 104 Engravings, 6s. 6d.

J. & A. CHURCHILL'S
MEDICAL CLASS BOOKS.

ANATOMY.

BRAUNE.—An Atlas of Topographical Anatomy, after Plane Sections of Frozen Bodies. By WILHELM BRAUNE, Professor of Anatomy in the University of Leipzig. Translated by EDWARD BELLAMY, F.R.C.S., and Member of the Board of Examiners; Surgeon to Charing Cross Hospital, and Lecturer on Anatomy in its School. With 34 Photo-lithographic Plates and 46 Woodcuts. Large imp. 8vo, 40s.

FLOWER.—Diagrams of the Nerves of the Human Body, exhibiting their Origin, Divisions, and Connexions, with their Distribution to the various Regions of the Cutaneous Surface, and to all the Muscles. By WILLIAM H. FLOWER, F.R.C.S., F.R.S. Hunterian Professor of Comparative Anatomy, and Conservator of the Museum, Royal College of Surgeons. Third Edition, containing 6 Plates. Royal 4to, 12s.

GODLEE.—An Atlas of Human Anatomy: illustrating most of the ordinary Dissections; and many not usually practised by the Student. By RICKMAN J. GODLEE, M.S., F.R.C.S., Assistant-Surgeon to University College Hospital, and Senior Demonstrator of Anatomy in University College. With 48 Imp. 4to Coloured Plates, containing 112 Figures, and a Volume of Explanatory Text, with many Engravings, 8vo, £4 14s. 6d.

HEATH.—Practical Anatomy: a Manual of Dissections. By CHRISTOPHER HEATH, F.R.C.S., Holme Professor of Clinical Surgery in University College and Surgeon to the Hospital. Fifth Edition. With 24 Coloured Plates and 269 Engravings. Crown 8vo, 15s.

NEW BURLINGTON STREET.

ANATOMY—*continued.*

HOLDEN.—A Manual of the Dissection of Human Body. By LUTHER HOLDEN, F.R.C.S., Consulting-Surgeon to St. Bartholomew's Hospital. Fourth Edition. Revised by the Author and JOHN LANGTON, F.R.C.S., Assistant Surgeon and Lecturer on Anatomy at St. Bartholomew's Hospital. With Engravings. 8vo, 16s.

By the same Author.

Human Osteology : comprising a Description of the Bones, with Delineations of the Attachments of the Muscles, the General and Microscopical Structure of Bone and its Development. Sixth Edition, revised by the Author and ALBAN DORAN, F.R.C.S., late Anatomical, now Pathological, Assistant to the Museum of the Royal College of Surgeons. With 61 Lithographic Plates and 89 Engravings. Royal 8vo.
[*Nearly ready.*]

ALSO,

Landmarks, Medical and Surgical. Third Edition. 8vo, 3s. 6d.

LANCEREAUX.—Atlas of Pathological Anatomy. By Dr. LANCEREAUX. Translated by W. S. GREENFIELD, M.D., Professor of Pathology in the University of Edinburgh. With 70 Coloured Plates. Imperial 8vo. £5 5s.

MORRIS.—The Anatomy of the Joints of Man. By HENRY MORRIS, M.A., F.R.C.S., Surgeon to, and Lecturer on Anatomy and Practical Surgery at, the Middlesex Hospital. With 11 Plates (19 Coloured) and Engravings. 8vo, 16s.

The Anatomical Remembrancer ; or, Complete Pocket Anatomist. Eighth Edition. 32mo, 3s. 6d.

WAGSTAFFE.—The Student's Guide to Human Osteology. By WM. WARWICK WAGSTAFFE, F.R.C.S., Assistant-Surgeon to, and Lecturer on Anatomy at, St. Thomas's Hospital. With 23 Plates and 65 Engravings. Fcap. 8vo, 10s. 6d.

NEW BURLINGTON STREET.

ANATOMY—*continued.*

WILSON — BUCHANAN — CLARK.—Wilson's

Anatomist's Vade-Mecum: a System of Human Anatomy. Tenth Edition, by GEORGE BUCHANAN, Professor of Clinical Surgery in the University of Glasgow, and HENRY E. CLARK, M.R.C.S., Lecturer on Anatomy in the Glasgow Royal Infirmary School of Medicine. With 450 Engravings, including 26 Coloured Plates. Crown 8vo, 18s.

BOTANY.

BENTLEY.—A Manual of Botany. By Robert

BENTLEY, F.L.S., Professor of Botany in King's College and to the Pharmaceutical Society. With nearly 1200 Engravings. Fourth Edition. Crown 8vo. [Nearly ready.]

BENTLEY AND TRIMEN.—Medicinal Plants:

being descriptions, with original Figures, of the Principal Plants employed in Medicine, and an account of their Properties and Uses. By ROBERT BENTLEY, F.L.S., and HENRY TRIMEN, M.B., F.L.S. In 4 Vols., large 8vo, with 306 Coloured Plates, bound in half morocco, gilt edges, £11 11s.

CHEMISTRY.

BERNAYS.—Notes for Students in Chemistry;

being a Syllabus of Chemistry compiled mainly from the Manuals of Fownes-Watts, Miller, Wurz, and Schorlemmer. By ALBERT J. BERNAYS, Ph.D., Professor of Chemistry at St. Thomas's Hospital. Sixth Edition. Fcap. 8vo, 3s. 6d.

By the same Author.

Skeleton Notes on Analytical Chemistry,

for Students in Medicine. Fcap. 8vo, 2s. 6d.

BOWMAN AND BLOXAM.—Practical Chemistry,

including Analysis. By JOHN E. BOWMAN, formerly Professor of Practical Chemistry in King's College, and CHARLES L. BLOXAM, Professor of Chemistry in King's College. With 93 Engravings. Seventh Edition. Fcap. 8vo, 6s. 6d.

CHEMISTRY—*continued.*

BLOXAM.—Chemistry, Inorganic and Organic ; with Experiments. By CHARLES L. BLOXAM, Professor of Chemistry in King's College. Fourth Edition. With nearly 300 Engravings. 8vo, 16s.

By the same Author.

Laboratory Teaching ; or, Progressive Exercises in Practical Chemistry. Fourth Edition. With 83 Engravings. Crown 8vo, 5s. 6d.

CLOWES.—Practical Chemistry and Qualitative Inorganic Analysis. An Elementary Treatise, specially adapted for use in the Laboratories of Schools and Colleges, and by Beginners. By FRANK CLOWES, D.Sc., Senior Science Master at the High School, Newcastle-under-Lyme. Third Edition. With 47 Engravings. Post 8vo, 7s. 6d.

FOWNES AND WATTS.—Physical and Inorganic Chemistry. Twelfth Edition. By GEORGE FOWNES, F.R.S., and HENRY WATTS, B.A., F.R.S. With 154 Engravings, and Coloured Plate of Spectra. Crown 8vo, 8s. 6d.

By the same Authors.

Chemistry of Carbon - Compounds, or Organic Chemistry. Twelfth Edition. With Engravings. Crown 8vo, 10s.

LUFF.—An Introduction to the Study of Chemistry. Specially designed for Medical and Pharmaceutical Students. By A. P. LUFF, F.I.C., F.C.S., Lecturer on Chemistry in the Central School of Chemistry and Pharmacy. Crown 8vo, 2s. 6d.

TIDY.—A Handbook of Modern Chemistry, Inorganic and Organic. By C. MEYMOTT TIDY, M.B., Professor of Chemistry and Medical Jurisprudence at the London Hospital. 8vo, 16s.

VACHER.—A Primer of Chemistry, including Analysis. By ARTHUR VACHER. 18mo, 1s.

NEW BURLINGTON STREET.

J. & A. Churchill's Medical Class Books.

CHEMISTRY—*continued.*

VALENTIN.—Introduction to Inorganic Chemistry. By WILLIAM G. VALENTIN, F.C.S. Third Edition. With 82 Engravings. Svo, 6s. 6d.

By the same Author.

A Course of Qualitative*Chemical Analysis.

Fifth Edition by W. R. HODGKINSON, Ph.D. (Würzburg), Demonstrator of Practical Chemistry in the Science Training Schools. With Engravings. Svo, 7s. 6d.

ALSO,

Chemical Tables for the Lecture-room and Laboratory. In Five large Sheets, 5s. 6d.

CHILDREN, DISEASES OF.

DAY.—A Treatise on the Diseases of Children.

For Practitioners and Students. By WILLIAM H. DAY, M.D., Physician to the Samaritan Hospital for Women and Children. Crown Svo, 12s. 6d.

ELLIS.—A Practical Manual of the Diseases

of Children. By EDWARD ELLIS, M.D., late Senior Physician to the Victoria Hospital for Sick Children. With a Formulary. Fourth Edition. Crown Svo. [Nearly ready.]

SMITH.—Clinical Studies of Disease in

Children. By EUSTACE SMITH, M.D., F.R.C.P., Physician to H.M. the King of the Belgians, and to the East London Hospital for Children. Post Svo, 7s. 6d.

By the same Author.

On the Wasting Diseases of Infants and Children. Third Edition. Post Svo, 8s. 6d.

STEINER.—Compendium of Children's Dis-

eases; a Handbook for Practitioners and Students. By JOHANN STEINER, M.D. Translated by LAWSON TAIT, F.R.C.S., Surgeon to the Birmingham Hospital for Women, &c., Svo, 12s. 6d.

NEW BURLINGTON STREET.

DENTISTRY.

SEWILL.—The Student's Guide to Dental

Anatomy and Surgery. By HENRY E. SEWILL, M.R.C.S., L.D.S., late Dental Surgeon to the West London Hospital. With 77 Engravings. Feap. 8vo, 5s. 6d.

SMITH.—Handbook of Dental Anatomy and

Surgery. For the Use of Students and Practitioners. By JOHN SMITH, M.D., F.R.S.E., Dental Surgeon to the Royal Infirmary, Edinburgh. Second Edition. Feap. 8vo, 4s. 6d.

STOCKEN.—Elements of Dental Materia Medica

and Therapeutics, with Pharmacopœia. By JAMES STOCKEN, L.D.S.R.C.S., late Lecturer on Dental Materia Medica and Therapeutics and Dental Surgeon to the National Dental Hospital. Third Edition. Feap. 8vo.

[*In the press.*]

TAFT.—A Practical Treatise on Operative

Dentistry. By JONATHAN TAFT, D.D.S., Professor of Operative Surgery in the Ohio College of Dental Surgery. Third Edition. With 134 Engravings. 8vo, 18s.

TOMES (C. S.).—Manual of Dental Anatomy,

Human and Comparative. By CHARLES S. TOMES, M.A., M.R.C.S., Lecturer on Anatomy and Physiology at the Dental Hospital of London. Second Edition. With Engravings. Crown 8vo. [*In preparation.*]

TOMES (J. and C. S.).—A Manual of Dental

Surgery. By JOHN TOMES, M.R.C.S., F.R.S., and CHARLES S. TOMES, M.A., M.R.C.S. Second Edition. With 262 Engravings. Feap. 8vo, 14s.

EAR, DISEASES OF.

BURNETT.—The Ear: its Anatomy, Physio-

logy, and Diseases. A Practical Treatise for the Use of Medical Students and Practitioners. By CHARLES H. BURNETT, M.D., Aural Surgeon to the Presbyterian Hospital, Philadelphia. With 87 Engravings. 8vo, 18s.

NEW BURLINGTON STREET.

EAR, DISEASES OF—*continued.*

DALBY.—On Diseases and Injuries of the Ear.

By WILLIAM B. DALBY, F.R.C.S., Aural Surgeon to, and Lecturer on Aural Surgery at, St. George's Hospital. Second Edition. With Engravings. Fcap. 8vo, 6s. 6d.

JONES.—A Practical Treatise on Aural Sur-

gery. By H. MACNAUGHTON JONES, M.D., Professor of the Queen's University in Ireland, Surgeon to the Cork Ophthalmic and Aural Hospital. With 46 Engravings. Crown 8vo, 5s.

By the same Author.

Atlas of the Diseases of the Membrana Tympani. In Coloured Plates, containing 59 Figures. With Explanatory Text. Crown 4to, 21s.

FORENSIC MEDICINE.

OGSTON.—Lectures on Medical Jurisprudence.

By FRANCIS OGSTON, M.D., Professor of Medical Jurisprudence and Medical Logic in the University of Aberdeen. Edited by FRANCIS OGSTON, Jun., M.D., Assistant to the Professor of Medical Jurisprudence and Lecturer on Practical Toxicology in the University of Aberdeen. With 12 Plates. 8vo, 15s.

TAYLOR.—The Principles and Practice of

Medical Jurisprudence. By ALFRED S. TAYLOR, M.D., F.R.S., late Professor of Medical Jurisprudence to Guy's Hospital. Second Edition. With 189 Engravings. 2 Vols. 8vo, 31s. 6d.

By the same Author.

A Manual of Medical Jurisprudence.

Tenth Edition. With 55 Engravings. Crown 8vo, 14s.

ALSO,

On Poisons, in relation to Medical Jurisprudence and Medicine. Third Edition. With 104 Engravings. Crown 8vo, 16s.

WOODMAN AND TIDY.—A Handy-Book of

Forensic Medicine and Toxicology. By W. BATHURST WOODMAN, M.D., F.R.C.P.; and C. MEYMOTT TIDY, M.B. With 8 Lithographic Plates and 116 Wood Engravings. 8vo, 31s. 6d.

HYGIENE.

PARKES.—A Manual of Practical Hygiene.

By EDMUND A. PARKES, M.D., F.R.S. Fifth Edition by F. DE CHAUMONT, M.D., F.R.S., Professor of Military Hygiene in the Army Medical School. With 9 Plates and 112 Engravings. Svo, 18s.

WILSON.—A Handbook of Hygiene and Sani-

tary Science. By GEORGE WILSON, M.A., M.D., Medical Officer of Health for Mid Warwickshire. Fourth Edition. With Engravings. Crown Svo, 10s. 6d.

MATERIA MEDICA AND THERAPEUTICS.

BINZ AND SPARKS.—The Elements of Thera-

peutics: a Clinical Guide to the Action of Medicines. By C. BINZ, M.D., Professor of Pharmacology in the University of Bonn. Translated and Edited with Additions, in conformity with the British and American Pharmacopœias, by EDWARD I. SPARKS, M.A., M.B., F.R.C.P. Lond. Crown Svo, 8s. 6d.

OWEN.—Tables of Materia Medica; com-

prising the Contents, Doses, Proportional Composition, and Methods of Manufacture of Pharmacopœial Preparations. By ISAMBARD OWEN, M.B., M.R.C.P., Lecturer on Materia Medica at St. George's Hospital. Fifth Edition. Crown Svo, 2s. 6d.

ROYLE AND HARLEY.—A Manual of Materia

Medica and Therapeutics. By J. FORBES ROYLE, M.D., F.R.S., and JOHN HARLEY, M.D., F.R.C.P., Physician to, and Joint Lecturer on Clinical Medicine at, St. Thomas's Hospital. Sixth Edition. With 139 Engravings. Crown Svo, 15s.

THOROWGOOD.—The Student's Guide to

Materia Medica. By JOHN C. THOROWGOOD, M.D., F.R.C.P., Lecturer on Materia Medica at the Middlesex Hospital. With Engravings. Fcap. Svo, 6s. 6d.

WARING.—A Manual of Practical Therapeu-

tics. By EDWARD J. WARING, C.B., M.D., F.R.C.P. Third Edition. Fcap. Svo, 12s. 6d.

MEDICINE.

BARCLAY.—A Manual of Medical Diagnosis.

By A. WHITE BARCLAY, M.D., F.R.C.P., Physician to, and Lecturer on Medicine at, St. George's Hospital. Third Edition. Feap. 8vo, 10s. 6d.

CHARTERIS.—The Student's Guide to the

Practice of Medicine. By MATTHEW CHARTERIS, M.D., Professor of Materia Medica, University of Glasgow; Physician to the Royal Infirmary. With Engravings on Copper and Wood. Third Edition. Feap. 8vo, 7s.

FENWICK.—The Student's Guide to Medical

Diagnosis. By SAMUEL FENWICK, M.D., F.R.C.P., Physician to the London Hospital. Fifth Edition. With 111 Engravings. Feap. 8vo, 7s.

By the same Author.

The Student's Outlines of Medical Treatment. Second Edition. Feap. 8vo, 7s.

FLINT.—Clinical Medicine : a Systematic Treatise on the Diagnosis and Treatment of Disease. By AUSTIN FLINT,

M.D., Professor of the Principles and Practice of Medicine, &c., in Bellevue Hospital Medical College. 8vo, 20s.

By the same Author.

A Manual of Percussion and Auscultation ;
of the Physical Diagnosis of Diseases of the Lungs and Heart, and
of Thoracic Aneurism. Post 8vo, 6s. 6d.

HALL.—Synopsis of the Diseases of the Larynx,

Lungs, and Heart : comprising Dr. Edwards' Tables on the Examination of the Chest. With Alterations and Additions. By F. DE HAVILLAND HALL, M.D., F.R.C.P., Assistant-Physician to the Westminster Hospital. Royal 8vo, 2s. 6d.

SANSOM.—Manual of the Physical Diagnosis

of Diseases of the Heart, including the use of the Sphygmograph and Cardiograph. By A. E. SANSOM, M.D., F.R.C.P., Assistant-Physician to the London Hospital. Third Edition, with 47 Woodcuts. Feap. 8vo, 7s. 6d.

MEDICINE—continued.

WARNER.—Student's Guide to Medical Case-Taking. By FRANCIS WARNER, M.D., Assistant-Physician to the London Hospital. Fcap. 8vo, 5s.

WHITTAKER.—Students' Primer on the Urine. By J. TRAVIS WHITTAKER, M.D., Clinical Demonstrator at the Royal Infirmary, Glasgow. With Illustrations, and 16 Plates etched on Copper. Post 8vo, 4s. 6d.

MIDWIFERY.

BARNES.—Lectures on Obstetric Operations, including the Treatment of Hæmorrhage, and forming a Guide to the Management of Difficult Labour. By ROBERT BARNES, M.D., F.R.C.P., Obstetric Physician to, and Lecturer on Diseases of Women, &c., at St. George's Hospital. Third Edition. With 124 Engravings. 8vo, 18s.

CLAY.—The Complete Handbook of Obstetric Surgery; or, Short Rules of Practice in every Emergency, from the Simplest to the most formidable Operations connected with the Science of Obstetrics. By CHARLES CLAY, M.D., late Senior Surgeon to, and Lecturer on Midwifery at, St. Mary's Hospital, Manchester. Third Edition. With 91 Engravings. Fcap. 8vo, 6s. 6d.

RAMSBOTHAM.—The Principles and Practice of Obstetric Medicine and Surgery. By FRANCIS H. RAMSBOTHAM, M.D., formerly Obstetric Physician to the London Hospital. Fifth Edition. With 120 Plates, forming one thick handsome volume. 8vo, 22s.

REYNOLDS.—Notes on Midwifery: specially designed to assist the Student in preparing for Examination. By J. J. REYNOLDS, M.R.C.S. Fcap. 8vo, 4s.

ROBERTS.—The Student's Guide to the Practice of Midwifery. By D. LLOYD ROBERTS, M.D., F.R.C.P., Physician to St. Mary's Hospital, Manchester. Second Edition. With 111 Engravings. Fcap. 8vo, 7s.

NEW BURLINGTON STREET.

MIDWIFERY—*continued.*

SCHROEDER.—A Manual of Midwifery ; including the Pathology of Pregnancy and the Puerperal State. By KARL SCHROEDER, M.D., Professor of Midwifery in the University of Erlangen. Translated by CHARLES H. CARTER, M.D. With Engravings. 8vo, 12s. 6d.

SWAYNE.—Obstetric Aphorisms for the Use of Students commencing Midwifery Practice. By JOSEPH G. SWAYNE, M.D., Lecturer on Midwifery at the Bristol School of Medicine. Seventh Edition. With Engravings. Fcap. 8vo, 3s. 6d.

MICROSCOPY.

CARPENTER.—The Microscope and its Revelations. By WILLIAM B. CARPENTER, C.B., M.D., F.R.S. Sixth Edition. With 26 Plates, a Coloured Frontispiece, and more than 500 Engravings. Crown 8vo, 16s.

MARSH.—Section-Cutting : a Practical Guide to the Preparation and Mounting of Sections for the Microscope, special prominence being given to the subject of Animal Sections. By Dr. SYLVESTER MARSH. With Engravings. Fcap. 8vo, 2s. 6d.

MARTIN.—A Manual of Microscopic Mounting. By JOHN H. MARTIN, Member of the Society of Public Analysts, &c. Second Edition. With several Plates and 144 Engravings. 8vo, 7s. 6d.

OPHTHALMOLOGY.

DAGUENET.—A Manual of Ophthalmoscopy for the Use of Students. By Dr. DAGUENET. Translated by C. S. JEAFFESON, Surgeon to the Newcastle-on-Tyne Eye Infirmary. With Engravings. Fcap. 8vo, 5s.

HIGGENS.—Hints on Ophthalmic Out-Patient Practice. By CHARLES HIGGENS, F.R.C.S., Ophthalmic Assistant-Surgeon to, and Lecturer on Ophthalmology at, Guy's Hospital. Second Edition. Fcap. 8vo, 3s.

NEW BURLINGTON STREET.

OPHTHALMOLOGY—*continued.*

- JONES.**—*A Manual of the Principles and Practice of Ophthalmic Medicine and Surgery.* By T. WHARTON JONES, F.R.C.S., F.R.S., late Ophthalmic Surgeon and Professor of Ophthalmology to University College Hospital. Third Edition. With 9 Coloured Plates and 173 Engravings. Fcap. 8vo, 12s. 6d.
- MACNAMARA.**—*A Manual of the Diseases of the Eye.* By CHARLES MACNAMARA, F.R.C.S., Surgeon to Westminster Hospital. Third Edition. With 7 Coloured Plates and 52 Engravings. Fcap. 8vo, 12s. 6d.
- NETTLESHIP.**—*The Student's Guide to Diseases of the Eye.* By EDWARD NETTLESHIP, F.R.C.S., Ophthalmic Surgeon to, and Lecturer on Ophthalmic Surgery at, St. Thomas's Hospital. With 48 Engravings. Fcap. 8vo, 7s. 6d.

PATHOLOGY.

- JONES AND SIEVEKING.**—*A Manual of Pathological Anatomy.* By C. HANDFIELD JONES, M.B., F.R.S., and EDWARD H. SIEVEKING, M.D., F.R.C.P. Second Edition. Edited, with considerable enlargement, by J. F. PAYNE, M.B., Assistant-Physician and Lecturer on General Pathology at St. Thomas's Hospital. With 195 Engravings. Crown 8vo, 16s.
- VIRCHOW.**—*Post-Mortem Examinations: a Description and Explanation of the Method of Performing them, with especial reference to Medico-Legal Practice.* By Professor RUDOLPH VIRCHOW, Berlin Charité Hospital. Translated by Dr. T. B. SMITH. Second Edition, with 4 Plates. Fcap. 8vo, 8s. 6d.
- WILKS AND MOXON.**—*Lectures on Pathological Anatomy.* By SAMUEL WILKS, M.D., F.R.S., Physician to, and Lecturer on Medicine at, Guy's Hospital; and WALTER MOXON, M.D., F.R.C.P., Physician to, and Lecturer on Clinical Medicine at, Guy's Hospital. Second Edition. With 7 Steel Plates. 8vo, 18s.

PSYCHOLOGY.

- BUCKNILL AND TUKE.**—*A Manual of Psychological Medicine: containing the Lunacy Laws, Nosology, Etiology, Statistics, Description, Diagnosis, Pathology, and Treatment of Insanity, with an Appendix of Cases.* By JOHN C. BUCKNILL, M.D., F.R.S., and D. HACK TUKE, M.D., F.R.C.P. Fourth Edition, with 12 Plates (30 Figures). 8vo, 25s.

NEW BURLINGTON STREET.

PHYSIOLOGY.

CARPENTER.—*Principles of Human Physiology.* By WILLIAM B. CARPENTER, C.B., M.D., F.R.S. Ninth Edition. Edited by Henry Power, M.B., F.R.C.S. With 3 Steel Plates and 377 Wood Engravings. Svo, 31s. 6d.

DALTON.—*A Treatise on Human Physiology :* designed for the use of Students and Practitioners of Medicine. By JOHN C. DALTON, M.D., Professor of Physiology and Hygiene in the College of Physicians and Surgeons, New York. Sixth Edition. With 316 Engravings. Royal Svo, 20s.

FREY.—*The Histology and Histo-Chemistry of Man.* A Treatise on the Elements of Composition and Structure of the Human Body. By HEINRICH FREY, Professor of Medicine in Zurich. Translated by ARTHUR E. BARKER, Assistant-Surgeon to the University College Hospital. With 608 Engravings. Svo, 21s.
